## Developing the TIMSS 2015 Achievement Items

Ina V.S. Mullis<br>Kerry E. Cotter<br>Bethany G. Fishbein<br>Victoria A.S. Centurino

## Unique Characteristics of TIMSS 2015

The general approach to developing the TIMSS mathematics and science achievement items is similar from assessment cycle to assessment cycle, but each assessment cycle tends to have some unique characteristics that influence the instrument development approach.

- For the first time since 1995, TIMSS and TIMSS Advanced were assessed together in 2015, providing 20 years of trend data for both assessments. TIMSS Advanced is the only international assessment that provides essential information about achievement in advanced mathematics and physics for students in their final year of secondary school. First conducted in 1995 and again in 2008, TIMSS Advanced together with TIMSS 2015 will provide countries with a complete profile of mathematics and science learning from elementary through the end of secondary school.
- TIMSS 2015 was the inaugural year of TIMSS Numeracy. TIMSS Numeracy was introduced in 2015 at the fourth grade to assess fundamental mathematics knowledge, procedures, and problem-solving strategies for students that were likely to find TIMSS 2015 at the fourth grade too difficult.

## The TIMSS Approach to Measuring Trends

Because TIMSS is designed to measure trends, the assessments of mathematics and science cannot change dramatically from cycle to cycle. That is, TIMSS is based on a well-known premise for designing trend assessments (ascribed to John Tukey and Albert Beaton):
"If you want to measure change, do not change the measure."
However, the achievement tests also need to be updated with each cycle to prevent the assessments from becoming dated and no longer relevant to current learning goals. It is important for the content to "keep up with the times" and to be innovative. For example, TIMSS needs
to reflect recent scientific discoveries and to be presented in situations consistent with students' instructional and everyday experiences.

To maintain continuity with past assessments while keeping up with current topics and technology, the TIMSS assessments evolve with each cycle. For assessing mathematics and science, TIMSS has a specific design for the steady release of items after each cycle and replacing them with newly developed items for the following cycle.

## Overview of the TIMSS 2015 Achievement Items

Although the majority of the assessment items are carried forward from the previous assessment cycle to measure trends, the task of updating the instruments for each new cycle-every four years for TIMSS since 1995-is a substantial undertaking. Because TIMSS assesses two subjects at two grades, it actually encompasses four different assessments of achievement: mathematics at the fourth and eighth grades and science at the fourth and eighth grades. The two TIMSS 2015 fourth grade assessments required developing and field testing 287 new items, and the two eighth grade assessments required developing and field testing 354 new items. TIMSS Numeracy, the new assessment added at the fourth grade, required developing and field testing 151 items.

## The Item Development Process

The TIMSS \& PIRLS International Study Center at Boston College uses a collaborative process to develop the new items needed for each TIMSS cycle. A broad overview of the process includes:

- Updating the frameworks for the upcoming assessment
- Developing items and their scoring guides in accordance with the frameworks
- Conducting a full-scale field test
- Selecting the new assessment items based on the frameworks, field test results, and existing items from previous cycles
- Conducting training in how to reliably score responses to constructed response items (i.e., questions to which students provide a written response rather than choosing from a set of options).

The development process is directed and managed by the staff of the TIMSS \& PIRLS International Study Center at Boston College, who collectively have considerable experience in the measurement and assessment of mathematics and science achievement. For TIMSS 2015, Executive Director, Ina Mullis, and Assistant Director of Mathematics, Kerry Cotter, managed the mathematics assessment development. Executive Director, Michael Martin, and Associate Director of Science, Victoria Centurino, managed the science assessment development.

Also playing a key role in achievement item development were the National Research Coordinators (NRCs) designated by their countries to be responsible for the complex tasks involved in implementing TIMSS in their countries. The TIMSS \& PIRLS International Study Center worked with the NRCs and experts from the countries to develop the new test items including the scoring guides for constructed response items. The NRCs also reviewed the items prior to the field test and helped select the items for the assessment after the field test.

The TIMSS \& PIRLS International Study Center prepares an international version of all the TIMSS assessment items in English. Subsequently, the items are translated by participating countries into their languages of instruction with the goal of creating high quality translations that are appropriately adapted for the national context and at the same time are internationally comparable. Therefore, a significant portion of the development and review effort by NRCs is dedicated to ensuring that the test items can be translated accurately.

To provide additional subject-matter expertise and support, external mathematics and science specialists consulted very closely with staff on the development activities. The TIMSS 2015 Chief Mathematics Consultant was Liv Sissel Gronmo, University of Oslo, ILS, Norway, and the TIMSS 2015 Chief Science Consultant was Lee Jones, United States.

Additional advice and guidance were provided through periodic reviews by the Science and Mathematics Review Committee (SMIRC). The SMIRC members for each TIMSS cycle are nominated by countries participating in TIMSS and provide guidance in developing the TIMSS assessments. The TIMSS 2015 SMIRC consisted of 16 members: 6 experts in mathematics and mathematics education and 10 experts in science and science education. It is necessary to have more science members to ensure expertise across the fields of biology, chemistry, and physics. During busy periods, two SMIRC committee members, Mary Lindquist for mathematics and Gerald Wheeler for science, served as advisors to assist in completing specific tasks, such as drafting updated mathematics and science content frameworks and updating scoring guides after the field test.

SMIRC members met four times for TIMSS 2015. At the $1^{\text {st }}$ SMIRC meeting in Oslo, Norway (April 2013), SMIRC reviewed the mathematics and science content frameworks and developed prototype field test items. At the $2^{\text {nd }}$ meeting in St. Petersburg, Russia (September 2013), SMIRC reviewed draft field test items, together with their scoring guides. At the $3^{\text {rd }}$ meeting in Sofia, Bulgaria (July 2014), SMIRC reviewed field test results and made recommendations to the NRCs regarding which items to include in the 2015 mathematics and science assessments. At the final meeting in Seoul, Korea (May 2016), SMIRC conducted the TIMSS 2015 scale anchoring process. Exhibit 1.1 lists the TIMSS 2015 SMIRC members.

## Updating the Mathematics and Science Assessment Frameworks for TIMSS 2015

Updating each TIMSS assessment for 2015 began with reviewing and modifying the assessment frameworks that specify the content to be assessed. The first two chapters of the TIMSS 2015 Assessment Frameworks, respectively, describe the mathematics and science frameworks in detail.

The basic structure of the TIMSS mathematics and TIMSS science assessment frameworks is based on two dimensions: content and cognitive. The content domains for mathematics at the fourth grade are number, geometric shapes and measures, and data display. The modified content domains for Numeracy are whole numbers, fractions and decimals, and shapes and measures. At the eighth grade, the mathematics content domains are number, algebra, geometry, and data and chance. For science, the content domains at the fourth grade are life science, physical science, and earth science; at the eighth grade, they are biology, chemistry, physics, and earth science.

Separately for the fourth and eighth grades, the TIMSS mathematics and science frameworks specify several topic areas within each content domain. For example, the algebra content domain contains three topic areas: expressions and operations, equations and inequalities, and relationships and functions. The cognitive domains are the same for mathematics and science: knowing, applying, and reasoning. However, the descriptions of the cognitive skills to be assessed differ somewhat between mathematics and science.

For TIMSS 2015, the mathematics and science frameworks were updated to better reflect the curricula and standards of the countries participating in TIMSS using information from the TIMSS 2011 Encyclopedia. These updates were discussed by the NRCs from the participating countries at their first meeting. Following the discussion at the $1^{\text {st }}$ NRC meeting, the NRCs consulted with their national experts and responded to a topic-by-topic survey about how best to update the content and cognitive domains for TIMSS 2015. Next, SMIRC reviewed and revised the frameworks. Using an iterative process, the frameworks as revised by the SMIRC were once again reviewed by the NRCs and updated a final time prior to publication.

Recommendations for updating content and cognitive domains can involve modifying content areas and their weightings (but no more than 5 percent); adding, deleting, or modifying topics within content areas to keep current with research findings and ensure that the number of topics reflects the content area weighting; rewriting to improve clarity for item writers; and perhaps combining some topic areas to reduce redundancy. New for 2015, a new section was added to the science frameworks that describes the science practices to be addressed in science assessments at the fourth and eighth grades. Beyond that, there were no changes in the weighting of content areas for either mathematics or science and only minor revisions to content area topics. The TIMSS 2015 Development schedule is presented in Exhibit 1.2.

## Exhibit 1.2: TIMSS 2015 Development Schedule for Achievement Items

| Date(s) |  | Group and Activity |
| :---: | :---: | :---: |
| July - December | 2012 | TIMSS \& PIRLS International Study Center conducted content analysis of the curricular topics described in the TIMSS 2011 Encyclopedia |
| October | 2012 | Task Force proposed updates for the 2015 Assessment Frameworks, incorporating results from the content analysis (Boston, USA) |
| January | 2013 | TIMSS \& PIRLS International Study Center compiled proposed updates to Assessment Frameworks in preparation for the $1^{\text {st }}$ National Research Coordinator (NRC) meeting |
| February | 2013 | NRCs reviewed proposed updates to Assessment Frameworks at $1^{\text {st }}$ NRC meeting (Hamburg, Germany) |
| March | 2013 | TIMSS \& PIRLS International Study Center incorporated feedback from $1^{\text {st }}$ NRC meeting to further refine the TIMSS 2015 Assessment Frameworks and surveyed NRCs online about proposed assessment topic areas and objectives |
| April | 2013 | Science and Mathematics Item Review Committee (SMIRC) reviewed proposed mathematics and science frameworks, developed innovative reasoning tasks and prototype items, and reviewed draft TIMSS 2015 Item Writing Guidelines at the $1^{\text {st }}$ SMIRC meeting (Oslo, Norway) |
| May | 2013 | TIMSS \& PIRLS International Study Center prepared final drafts of TIMSS 2015 mathematics and science assessment frameworks, incorporating SMIRC and NRC comments |
| May | 2013 | TIMSS \& PIRLS International Study Center updated TIMSS 2015 Item Writing Guidelines |
| May | 2013 | NRCs reviewed TIMSS 2015 Assessment Frameworks and developed draft field test items using TIMSS 2015 Item Writing Guidelines at $2^{\text {nd }}$ NRC meeting (Amsterdam, The Netherlands) |
| June - August | 2013 | TIMSS \& PIRLS International Study Center further refined draft field test items and scoring guides and continued to develop additional items to cover frameworks |
| July | 2013 | Science and Mathematics Task Forces reviewed and edited draft field test items and scoring guides, developed additional items to cover the frameworks, and classified items into preferred and alternate sets (Boston, USA) |
| September | 2013 | SMIRC reviewed draft field test items and scoring guides at $2^{\text {nd }}$ SMIRC meeting (St. Petersburg, Russia) |
| September | 2013 | TIMSS \& PIRLS International Study Center published TIMSS 2015 Assessment Frameworks |
| September - October | 2013 | TIMSS \& PIRLS International Study Center revised draft field test items and scoring guides to address SMIRC comments |
| November | 2013 | NRCs reviewed and approved proposed field test items at $3^{\text {rd }}$ NRC meeting (Budapest, Hungary) |
| November - December | 2013 | TIMSS \& PIRLS International Study Center assembled field test items into assessment blocks |
| December | 2013 | TIMSS \& PIRLS International Study Center distributed field test achievement booklets to NRCs |
| January | 2014 | TIMSS \& PIRLS International Study Center collected student responses to constructed response items from English-speaking countries to develop scoring training materials |

Exhibit 1.2: TIMSS 2015 Development Schedule for Achievement Items (Continued)

| Date(s) |  | Group and Activity |
| :---: | :---: | :---: |
| February | 2014 | Science and Mathematics Task Forces modified scoring guides for constructed response items based on student responses and developed scoring training materials for $4^{\text {th }}$ NRC meeting (Boston, USA) |
| March - April | 2014 | Countries conducted TIMSS 2015 field test |
| March | 2014 | NRCs received scoring training for TIMSS 2015 constructed response field test items at $4^{\text {th }}$ NRC meeting (Sydney, Australia) |
| April - May | 2014 | Countries submitted field test achievement data for analysis and review |
| June | 2014 | Science and Mathematics Task Forces reviewed field test item statistics |
| June - July | 2014 | TIMSS \& PIRLS International Study center assembled proposed item blocks in preparation for the $3^{\text {rd }}$ SMIRC meeting |
| July | 2014 | SMIRC reviewed proposed item blocks in conjunction with field test results at $3^{\text {rd }}$ SMIRC meeting (Sofia, Bulgaria) |
| August | 2014 | NRCs reviewed and approved item blocks for TIMSS 2015 data collection at $5^{\text {th }}$ NRC meeting |
| August | 2014 | TIMSS \& PIRLS International Study Center distributed TIMSS 2015 data collection achievement booklets to NRCs |
| October - December | 2014 | Southern Hemisphere countries conducted TIMSS 2015 data collection |
| October | 2014 | TIMSS \& PIRLS International Study Center updated and prepared materials for TIMSS 2015 constructed response item scoring training |
| November | 2014 | NRCs from Southern Hemisphere countries received scoring training for constructed response items (Wellington, New Zealand) |
| November | 2014 | TIMSS \& PIRLS International Study Center finalized scoring guides and training materials for constructed response items and distributed them to NRCs |
| March | 2015 | NRCs from Northern Hemisphere countries received scoring training for constructed response items at $6^{\text {th }}$ NRC meeting (Prague, Czech Republic) |
| March - June | 2015 | Northern Hemisphere countries conducted TIMSS 2015 data collection |

## Writing and Reviewing the TIMSS 2015 Field Test Items and Scoring Guides

The TIMSS \& PIRLS International Study Center uses a collaborative process involving the participating countries to develop test items and scoring guides for the field tests. Most of the $2^{\text {nd }}$ TIMSS NRC meeting in Amsterdam was devoted to a workshop for developing the field test items. The NRCs, together with experienced item writers from participating countries and staff from the TIMSS \& PIRLS International Study Center, created the newly developed items for the mathematics and science field tests.

Prior to the workshop, TIMSS \& PIRLS International Study Center staff members identified the scope of the item writing task for the field test, examining the weight given to each topic in each of the updated frameworks. Considerations included the total items needed based on the percentage
of weight assigned to a particular area (for example, geometric measurement) in the TIMSS 2015 Assessment Frameworks, and the number of topics in that area (two, for example), as well as how many items existed from previous assessments. Because the TIMSS \& PIRLS International Study Center generally field tests twice the number of items actually required, the field test included the target number of new items needed multiplied by two. For TIMSS 2015, about 800 items were field tested (see Exhibit 1.4).

In preparation for the item writing workshop, the TIMSS \& PIRLS International Study Center updated the TIMSS 2015 Item Writing Guidelines, an item writing manual specifically developed for TIMSS assessments. The Item Writing Guidelines contain general information about procedures for obtaining good measurement (for instance, items should be independent and not provide clues to the correct responses of other items) as well as specific information on how to deal with translation and comparability issues (for example, using TIMSS' fictitious unit of currency, the "zed," for any money items). The Item Writing Guidelines include the necessary steps for developing scoring guides, as well as checklists for reviewing TIMSS items.

At the TIMSS item writing workshop, country representatives were divided into teams and given specific item writing assignments to ensure that enough field test items were developed in each of the content areas and cognitive processes areas specified in the frameworks. The TIMSS \& PIRLS International Study Center staff and consultants used the Item Writing Guidelines to provide training to the teams on item writing procedures for the TIMSS assessments. Once teams had completed their item writing assignments, each team reviewed the items drafted by other teams. In addition, some teams continued to send items to the TIMSS \& PIRLS International Study Center for several weeks after the item writing workshop. Exhibit 1.3 shows the number of participants in the TIMSS 2015 item writing workshop and the number of items written.

Exhibit 1.3: TIMSS 2015 Item Writing Workshop to Develop Field Test Items

| Attendees |  |
| :--- | :---: |
| Number of Countries and Benchmarking Entities | 45 |
| Number of Country Representatives | 114 |
| Approximate Number of Field Test Items Written at |  |
| Item Writing Workshop | 160 |
| Fourth Grade Mathematics | 200 |
| Eighth Grade Mathematics | 160 |
| Fourth Grade Science | 270 |
| Eighth Grade Science |  |

Following the item writing workshop, the draft set of field test items received a thorough review by the TIMSS \& PIRLS International Study Center. Reviewers included staff, the chief consultants, and consultants experienced in developing assessment items, such as those from Educational Testing Service, the National Foundation for Educational Research in England, and the Australian Council for Educational Research, as well as SMIRC members with particular item writing skills.

Finally, the proposed field test blocks were reviewed by the TIMSS 2015 SMIRC and NRCs prior to field test instrument production. The TIMSS \& PIRLS International Study Center implemented the suggested revisions and provided the final international version of the field test booklets to the NRCs so that they could begin translating the field test materials into their languages of instruction.

## The TIMSS 2015 Field Test

The TIMSS field test followed typical TIMSS procedures, where it served as a full-scale "dress rehearsal" operationally for the assessment. That is, the data collection and scoring procedures to be employed in the assessment were practiced in the field test. In addition, the field test provided important information about how well each prospective item functioned and provided a basis for selecting items for the assessment.

The field test was designed to be conducted for approximately 30 schools in each country and yield at least 200 student responses to each mathematics and science item. Generally, the samples for the field test and the assessment are drawn simultaneously, using the same random sampling procedures. This ensures that field test samples closely approximate assessment samples, and that a school is selected for either the field test or the assessment, but not both. For example, if 150 schools are needed for the assessment and another 30 for the field test, then a larger sample of 180 schools is selected and a systematic sample of 30 schools is selected from the 180 schools.

The TIMSS 2015 field test was conducted in March-April 2014. Exhibits 1.4 through 1.8 provide a detailed summary of the field test effort, including the number of students, teachers, and schools that participated, and the number of items listed by format, content domain, and cognitive domain. Approximately 10,000 student responses from more than 40 countries per grade were used to evaluate the measurement properties of each field test assessment item.

Exhibit 1.4: Overview of the TIMSS 2015 Field Test

|  | Fourth Grade | Numeracy | Eighth Grade |
| :--- | :---: | :---: | :---: |
| Items |  |  |  |

## Developing the Materials for TIMSS 2015 Field Test Scoring Training

It is necessary to prepare scoring training materials for the newly developed constructed response field test items in advance of the field test so field test scoring can occur immediately upon completion of data collection. To provide "grist" for these materials, Canada, Ireland, and Singapore, administered the newly developed constructed response field test items in a small selection of classrooms with English-speaking students. Pilot materials were completed in December 2013 and responses were gathered from students in January 2014. The goal was to collect a total of approximately 200 responses to each newly developed constructed response field test item to provide example student responses in the field test scoring guides and sets of training materials. Exhibit 1.9 provides the number of items included in the pilot test and the number of student responses collected.

# Exhibit 1.9: Pilot Test Student Responses for Field Test Scoring Training Materials Development 

|  | Fourth Grade | Eighth Grade |
| :--- | :---: | :---: |
| Items |  |  |
| Mathematics | 24 | 24 |
| Science | 49 | 76 |
| Total | $\mathbf{7 3}$ | $\mathbf{1 0 0}$ |
| Responses per Item (approx.) | 180 | 160 |
| Participants | Canada, Ireland, <br> Singapore | Canada, Ireland, <br> Singapore |
| Countries | 360 | 320 |
| Number of Students (approx.) |  |  |

Additionally, the United States arranged for cognitive labs in Washington, D.C. and California. Each TIMSS constructed response item was presented to approximately five students, who were observed and prompted to answer questions about the clarity, difficulty, and familiarity of the item content and format. The TIMSS \& PIRLS International Study Center received the cognitive lab reports in February 2014. Exhibit 1.10 provides the number of items included in the cognitive labs and the number of student responses collected.

Exhibit 1.10: Cognitive Lab Student Responses

|  | Fourth Grade | Eighth Grade |
| :--- | :---: | :---: |
| Mathematics Items | 20 | 20 |
| Science Items | 20 | 20 |
| Total Items | $\mathbf{4 0}$ | $\mathbf{4 0}$ |
| Responses per Item (approx.) | 5 | 5 |
| Number of Students (approx.) | 50 | 50 |

The TIMSS 2015 NRCs and their scoring supervisors received scoring training for the field test constructed response items in March 2014 in Sydney, Australia, as part of the $4^{\text {th }}$ TIMSS 2015 NRC Meeting. Sets of example and practice papers were created for 34 fourth grade items and 33 eighth grade items. The example and practice paper sets for each item included a scoring guide, approximately $8-10$ example papers illustrating the categories in the scoring guide, and approximately $8-10$ practice papers so that country representatives could practice making distinctions among categories and reach agreement about how to make consistent scoring decisions across countries.

At the scoring training sessions, the trainers explained the purpose of each item and read it aloud. The trainer then described the scoring guide, explaining each category and the rationale
for the score given to each example paper. After the country representatives scored the practice papers, any inconsistencies in scoring were discussed, and, as necessary, the field test guides were clarified and sometimes categories were revised.

## Finalizing the TIMSS 2015 Achievement Items

Subsequent to the field test, the TIMSS \& PIRLS International Study Center analyzed the TIMSS field test data and prepared almanacs containing summary item statistics for each field test item. The data almanac for an item contained, row by row for each country: the sample size, the item difficulty and discrimination, the percentage of students answering each option (multiplechoice) or in each score category (constructed response), the point-biserial correlation for each multiple-choice option or constructed response category, and the degree of scoring agreement for constructed response items.

The field test data were used by the TIMSS \& PIRLS International Study Center, expert committees, and NRCs to assess the quality of the field test items. The TIMSS \& PIRLS International Study Center staff members, together with external consultants, first reviewed the field test data to make an initial judgment about the quality of each item based on its measurement properties (item statistics). Items were eliminated from further consideration if they had poor measurement properties, such as being too difficult or easy or having low discrimination. Particular attention was paid to unusual item statistics in individual countries since these could indicate errors in translation.

After the item-by-item review, the TIMSS \& PIRLS International Study Center staff collaborated with consultants to assemble a set of recommended assessment blocks for review by the expert committee (SMIRC). SMIRC members scrutinized the recommendations for the newly developed assessment blocks, reviewing the items and scoring guides for content accuracy, clarity, and adherence to the frameworks. In addition, the newly developed items were considered in relation to the trend item blocks for overall coherence as a complete assessment.

The SMIRC's recommendations were implemented by staff, and the penultimate assessment blocks were sent to the NRCs for review. NRCs had the opportunity to review the recommended materials in light of the field test results and within the security of their own countries. Each country also could check any unusual national results that might be an indication of translation errors and correct the translation as necessary or recommend revisions to accommodate translation. Finally, the $5^{\text {th }}$ NRC meeting held in Paris, France in August 2014 was devoted to reviewing all the newly developed items.

## Distribution of TIMSS 2015 Items by Content and Cognitive Domains

Exhibits 1.11 through 1.14 present the number of trend and newly developed items as well as the number of score points in the TIMSS 2015 mathematics and science assessments. The number of items represents the number of distinct questions in the assessment, while the number of score points represents the complexity and weight given to each item.

Exhibit 1.11: TIMSS 2015 Achievement Items by Content Domain - Fourth Grade

| Content Domain | Number of Trend Items in TIMSS 2015 | Percentage of Trend Score Points | Number of New Items in TIMSS 2015 | Percentage of New Score Points | Total Items | Achieved Percentage of Score Points | Target Percentage of Score Points |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mathematics Items |  |  |  |  |  |  |  |
| Number | 48 (49) | 46\% | 41 (46) | 61\% | 89 (95) | 52\% | 50\% |
| Geometric Shapes and Measures | 37 (38) | 36\% | 19 (21) | 28\% | 56 (59) | 32\% | 35\% |
| Data Display | 17 (19) | 18\% | 7 (9) | 12\% | 24 (28) | 15\% | 15\% |
| Total | 102 (106) |  | 67 (76) |  | 169 (182) |  |  |
| Mathematics - Numeracy Items |  |  |  |  |  |  |  |
| Whole Numbers |  |  | 52 (53) | 50\% | 52 (53) | 50\% | 50\% |
| Fractions and Decimals |  |  | 15 (15) | 14\% | 15 (15) | 14\% | 15\% |
| Shapes and Measures |  |  | 35 (38) | 36\% | 35 (38) | 36\% | 35\% |
| Total |  |  | 102 (106) |  | 102 (106) |  |  |
| Science Items |  |  |  |  |  |  |  |
| Life Science | 47 (52) | 48\% | 32 (35) | 44\% | 79 (87) | 46\% | 45\% |
| Physical Science | 35 (35) | 32\% | 29 (30) | 38\% | 64 (65) | 35\% | 35\% |
| Earth Science | 19 (22) | 20\% | 14 (14) | 18\% | 33 (36) | 19\% | 20\% |
| Total | 101 (109) |  | 75 (79) |  | 176 (188) |  |  |

Score points are shown in parentheses.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.
Counts of TIMSS Numeracy achievement items do not include the two fourth grade TIMSS 2015 mathematics blocks (see Chapter 4 ofthe TIMSS 2015 Assessment Frameworks).

Exhibit 1.12: TIMSS 2015 Achievement Items by Cognitive Domain - Fourth Grade

| Total | 128 (134) |  | 92 (105) |  | 220 (239) |  |  |

Score points are shown in parentheses.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

## Distribution of TIMSS 2015 Item Formats within Content and Cognitive Domains

Exhibits 1.15 through 1.18 display the number of items (and score points) by item format for each content and cognitive domain. As described in the TIMSS 2015 Assessment Frameworks, at least half of the total number of score points represented by all the questions should come from multiple-choice items. Most TIMSS multiple-choice items are worth one score point, although some compound multiple-choice items are worth two score points. The 2-point compound multiplechoice items are scored as all parts answered correctly as fully correct ( 2 score points), and most parts answered correctly as partially correct ( 1 score point). Constructed response items generally are worth one or two score points depending on the degree of complexity involved. The 1-point constructed response items are scored as correct ( 1 score point) or incorrect ( 0 score points), whereas 2-point constructed response items are scored as fully correct ( 2 score points), partially correct ( 1 score point), or incorrect ( 0 score points). Fully correct responses show a complete or deeper understanding of a task while partially correct responses demonstrate only a partial understanding of the concepts or procedures embodied in the task.

Exhibit 1.15: TIMSS 2015 Achievement Items by Content Domain and Item Format Fourth Grade

| Mathematics Items |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Number | 44 (44) | 2 (2) | 37 (37) | 6 (12) | 89 (95) | 52\% |
| Geometric Shapes and Measures | 35 (35) |  | 18 (18) | 3 (6) | 56 (59) | 32\% |
| Data Display | 8 (8) |  | 12 (12) | 4 (8) | 24 (28) | 15\% |
| Total | 87 (87) | 2 (2) | 67 (67) | 13 (26) | 169 (182) |  |
| Achieved Percentage of Score Points |  |  |  |  |  |  |
| Target Percentage of Score Points |  |  |  |  |  |  |
| Mathematics - Numeracy Items |  |  |  |  |  |  |
| Whole Numbers | 21 (21) |  | 30 (30) | 1 (2) | 52 (53) | 50\% |
| Fractions and Decimals | 7 (7) |  | 8 (8) |  | 15 (15) | 14\% |
| Shapes and Measures | 17 (17) | 1 (1) | 14 (14) | 3 (6) | 35 (38) | 36\% |
| Total | 45 (45) | 1 (1) | 52 (52) | 4 (8) | 102 (106) |  |
| Achieved Percentage of Score Points | 43\% |  | 57\% |  |  |  |
| Target Percentage of Score Points | 50\% |  | 50\% |  |  |  |
| Science Items |  |  |  |  |  |  |
| Life Science | 37 (37) | 2 (2) | 32 (32) | 8 (16) | 79 (87) | 46\% |

Score points are shown in parentheses.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

## TIMSS 2015 Constructed Response Scoring Training

In preparation for the main data collection scoring training, some TIMSS 2015 scoring guides were further refined or clarified based on the results of the field test. This also included a thorough review of the field test scoring training materials to ensure that the student responses were still suitable for the updated scoring guides. In some cases, example and practice sets used in the field test were expanded to further illustrate particular aspects of a scoring guide. For TIMSS 2015 scoring training, the example and practice paper training sets included those used in TIMSS 2011 for the trend items and the updated training sets for the newly developed items selected for TIMSS 2015, resulting in 27 example and practice paper sets for fourth grade and 29 for eighth grade.

To provide scoring training for all the countries participating in TIMSS 2015, the TIMSS \& PIRLS International Study Center conducted two training sessions. First, the NRCs for Southern Hemisphere countries and their scoring supervisors received scoring training in November 2014 in Wellington, New Zealand. NRCs for Northern Hemisphere countries and their scoring supervisors received scoring training in March 2015 in Prague, Czech Republic as part of the $6^{\text {th }}$ TIMSS 2015 NRC Meeting. Exhibit 1.19 shows the number of participants in the two scoring training sessions.

Exhibit 1.19: TIMSS 2015 Scoring Training Participation

| Participants | Southern <br> Hemisphere | Northern <br> Hemisphere |
| :--- | :---: | :---: |
| Number of Countries | 8 | 58 |
| Number of Benchmarking Entities | 1 | 5 |
| Number of Country Representatives | 32 | 152 |

## The Process Following Instrument Development

In general, after the participating countries received the international version of the assessment instruments, they began the process of translation and cultural adaptation (some adaptation to local usage typically is necessary even in English-speaking countries) and production of the materials for printing. At the same time, countries made final arrangements for data collection, including the host of activities necessary to obtain school participation, implement test administration, and score the responses to the tests and questionnaires (see following chapters).

## CHAPTER 2

## Developing the TIMSS 2015 Context Questionnaires

Martin Hooper

The primary purpose of the TIMSS context questionnaires is to study the home, community, school, and classroom contexts in which students learn mathematics and science. To this end, questionnaire data are collected from students, and their parents, teachers, and principals. National Research Coordinators (NRCs) from participating countries provide country-level data. The questionnaire data when analyzed in relation to TIMSS achievement yield insights into factors related to student achievement that can be relevant in developing educational policy.

The context questionnaire results form the basis for seven of the ten chapters of the TIMSS 2015 International Results reports. The descriptive data collected through the TIMSS Curriculum Questionnaires complement each country's chapter included in the TIMSS 2015 Encyclopedia.

## Development Process for the TIMSS 2015 Context Questionnaires

Developing the TIMSS 2015 context questionnaires was a collaborative process involving multiple rounds of reviews by staff at the TIMSS \& PIRLS International Study Center, policy analysis experts on the TIMSS 2015 Questionnaire Item Review Committee (QIRC), and the NRCs from the participating countries. In broad strokes, the TIMSS 2015 context questionnaire development process for the student, home, school, and teacher questionnaires included:

- Updating the context questionnaire framework for 2015
- Modifying and developing new context questionnaire items by staff at the TIMSS \& PIRLS International Study Center
- Reviewing and revising the questionnaires by the QIRC and NRCs
- Administering the TIMSS 2015 field test
- Using the field test results to refine the questionnaires

Developing the Curriculum Questionnaires followed a collaborative cycle similar to other TIMSS questionnaires, including identifying important framework topics, developing questionnaire items, and iterative reviews by NRCs.

Exhibit 2.1 presents the TIMSS 2015 questionnaire development schedule. The development process was directed and managed by the staff of the TIMSS \& PIRLS International Study Center at Boston College, including Executive Directors Ina V.S. Mullis and Michael O. Martin, and the TIMSS Questionnaire Coordinator, Martin Hooper. NRCs had an essential role in updating the questionnaires, providing feedback and ideas through an online review and at successive NRC meetings. The QIRC made major contributions in updating the TIMSS 2015 questionnaires with the $1^{\text {st }}$ QIRC meeting focused on developing TIMSS items/scales, and the $2^{\text {nd }}$ meeting focused on refining the questionnaires in light of the field test results. Exhibit 2.2 lists the members of the QIRC.

Exhibit 2.1: TIMSS 2015 Context Questionnaire Development Schedule

| Date(s) |  | Group and Activity |
| :---: | :---: | :---: |
| February | 2013 | NRCs reviewed TIMSS 2011 context questionnaires at the $1^{\text {st }}$ NRC meeting (Hamburg, Germany) |
| February-May | 2013 | Staff at TIMSS \& PIRLS International Study Center draft the Context Questionnaire Framework chapter |
| May | 2013 | NRCs reviewed the Context Questionnaire Framework chapter at their $2^{\text {nd }}$ NRC meeting (Amsterdam, The Netherlands) |
| May-June | 2013 | Staff at TIMSS \& PIRLS International Study Center revised the draft Context Questionnaire Framework chapter to incorporate NRC feedback and began questionnaire item writing for TIMSS 2015 |
| June | 2013 | $1^{\text {st }}$ meeting of the Questionnaire Item Review Committee (QIRC) to review the draft TIMSS 2015 Context Questionnaire Framework and the draft TIMSS 2015 questionnaires (Singapore) |
| July-August | 2013 | TIMSS \& PIRLS International Study Center revised the draft context questionnaires to incorporate QIRC/QDG feedback and finalized a draft of the TIMSS 2015 Context Questionnaire Chapter |
| August-September | 2013 | NRCs review draft questionnaires online |
| September | 2013 | Staff at TIMSS \& PIRLS International Study Center published TIMSS 2015 Assessment Frameworks, which includes the chapter on the Context Questionnaire Framework |
| September-October | 2013 | Staff at TIMSS \& PIRLS International Study Center revised the draft context questionnaires to address NRC comments from the online review |
| November | 2013 | NRCs reviewed and approved proposed context questionnaires at $3^{\text {rd }}$ NRC meeting (Budapest, Hungary) |
| November-December | 2013 | Staff at TIMSS \& PIRLS International Study Center finalized field test context questionnaire instruments |
| December | 2013 | Staff at TIMSS \& PIRLS International Study Center provided field test context questionnaires to NRCs |
| March-April | 2014 | Countries conducted TIMSS 2015 field test |
| March | 2014 | NRCs reviewed and provided feedback on TIMSS 2011 Curriculum Questionnaires at $4^{\text {th }}$ NRC meeting (Sydney, Australia) |

Together with TIMSS at the fourth and eighth grades, TIMSS 2015 included TIMSS Numeracy at the fourth grade and the TIMSS Advanced assessments in mathematics and physics at the final year of secondary school. Countries participating in TIMSS Numeracy administered the TIMSS 2015 fourth grade questionnaires. TIMSS Advanced, however, required separate questionnaires geared toward the context for learning of STEM-track students during their final year of schooling. Although the TIMSS eighth grade questionnaires served as a foundation for developing the TIMSS Advanced 2015 questionnaires, the TIMSS Advanced questionnaires included numerous differences from the TIMSS questionnaires. Additional information on developing the TIMSS Advanced questionnaires can be found in Chapter 2 of Methods and Procedures in TIMSS Advanced 2015.

## Background of TIMSS 2015 Context Questionnaire Development

Similar to the development process for the TIMSS 2015 achievement booklets (see Chapter 1), questionnaire development balanced the dual purposes of maintaining continuity with previous assessments and evolving to reflect the current contexts for student learning. Therefore, the TIMSS 2015 questionnaires can be viewed as the latest evolution of six cycles of TIMSS questionnaires dating back to TIMSS 1995. In particular, the TIMSS 2015 questionnaires are built upon the successes of the TIMSS 2011 questionnaires, with modifications to align the questionnaires with more recent research and policy innovations.

A major methodological innovation in TIMSS 2011 was using context questionnaire scales to measure key educational research topics (Martin, Mullis, Foy, \& Arora, 2012). TIMSS 2015 questionnaire development focused on writing items to strengthen the measurement properties of the TIMSS 2011 scales as well as developing new scales to measure emerging areas of educational research.

In 2011, the TIMSS and PIRLS cycles coincided, and 34 countries chose to administer both TIMSS and PIRLS to the same fourth grade students. Accordingly, the TIMSS 2011 and PIRLS 2011 questionnaires were developed in tandem (see Methods and Procedures in TIMSS and PIRLS 2011 for details). Overall, this joint development process produced a synergy that led to advancements in questionnaire development for both projects, and shared items across TIMSS and PIRLS 2011 allowed results to be compared across projects. TIMSS 2015 made an effort to maintain the consistency with PIRLS by holding the $1^{\text {st }}$ meeting of the QIRC with its PIRLS equivalentthe Questionnaire Development Group (QDG). Also, TIMSS 2015 questionnaire development considered the suggested revisions to overlapping TIMSS/PIRLS questionnaire items made at PIRLS NRCs meetings.

The joint administration of TIMSS and PIRLS 2011 to the same students allowed data collected through the PIRLS home questionnaire to be linked with TIMSS questionnaire and achievement data. Consequently, the TIMSS 2011 reports for the first time included data collected
from parents on areas like early childhood numeracy activities, home resources for learning, and language use in the home. Given the wealth of information provided by the home questionnaire, the TIMSS 2015 NRCs decided that a TIMSS-specific home questionnaire, entitled the Early Learning Survey, should be developed and administered at the fourth grade.

## Updating the TIMSS 2015 Context Questionnaire Framework

The TIMSS 2015 Context Questionnaire Framework, Chapter 3 of the TIMSS 2015 Assessment Frameworks, provided the foundation for updating the TIMSS context questionnaires for 2015. The Framework chapter presents a review of a vast array of educational research that identifies key context questionnaire topics and gives the theoretical justification for asking about these topics within the 2015 questionnaires.

At the $1^{\text {st }}$ NRC meeting in February 2013 in Hamburg, Germany, NRCs described topics they thought should be covered in the TIMSS 2015 questionnaires, including which TIMSS 2011 topics should be retained to measure trends. Taking into account feedback garnered in the meeting, the TIMSS Questionnaire Coordinator conducted an extensive literature review and drafted the TIMSS 2015 Questionnaire Framework chapter. Because the primary purpose of the context questionnaires is to identify factors that may contribute to differences in achievement within and between countries, the framework focuses on topics in educational research found to be related to achievement across a variety of settings and contexts.

The NRCs reviewed the draft chapter at the $2^{\text {nd }}$ NRC meeting in May 2013 in Amsterdam, and the QIRC reviewed it at their first meeting in June 2013 in Singapore. Staff at the TIMSS \& PIRLS International Study Center refined the draft based upon the recommendations received at the two meetings and published the final TIMSS 2015 Assessment Frameworks online in September 2013, with printed copies distributed thereafter.

## Field Test Questionnaire Development

With the draft Context Questionnaire Framework at hand, staff at the TIMSS \& PIRLS International Study Center focused the questionnaire development process on improving and expanding the TIMSS context questionnaire scales, developing the TIMSS Early Learning Survey, and updating items to align with more recent technological innovations.

For many of the scales retained from TIMSS 2011, modifications for 2015 focused on increasing the number of items to optimize reliability and content coverage. For example, a number of new items were written for the School Emphasis on Academic Success scale, with item development influenced by existing scales in the academic optimism literature (Hoy, Hoy, \& Kurz, 2008; McGuigan \& Hoy, 2006; Wu, Hoy, \& Tarter, 2013). Additional items were also included for the student engagement scales, with one item sourced from Fauth, Decristan, Rieser, Klieme, and Büttner (2014).

Staff at the TIMSS \& PIRLS International Study Center worked with the TIMSS QIRC/PIRLS QDG at their joint meeting in June 2013 to recast a number of scales. For instance, the QIRC and QDG revamped the teacher job satisfaction scale to integrate insights gained from the Utrecht Work Engagement Scale (Schaufeli, Bakker, \& Salanova, 2006). The questionnaire committees also revised the Confidence in Teaching Mathematics/Science scales, with item development influenced by the Ohio State Teacher Efficacy Scale (Tschannen-Moran \& Hoy, 2001).

Although the PIRLS home questionnaire served as a foundation for the development of the TIMSS Early Learning Survey, numerous new items needed to be developed to focus the TIMSS questionnaire on the contexts for learning mathematics and science. One new scale included in the Early Learning Survey is the Parental Attitude toward Mathematics and Science scale—developed to assess parents' feelings towards STEM fields.

Finally, updating questionnaires to "keep up with the times" was an essential part of the 2015 development process. Staff at the TIMSS \& PIRLS International Study Center worked with the QIRC and QDG to ensure that the questionnaires included items on the availability of prevalent digital resources for education such as ebooks, tablets, and interactive whiteboards.

## Review Field Test Results and Refine Questionnaires for Data Collection

TIMSS 2015 countries administered an ambitious field test, eliciting questionnaire data from 111,194 students, 59,200 parents, 2,775 principals, and 10,165 teachers across 43 countries and five benchmarking entities at the fourth grade, 7 countries for TIMSS Numeracy, and 37 countries and 4 benchmarking entities at the eighth grade.

Following field test administration, staff at the TIMSS \& PIRLS International Study Center produced data almanacs and scale summaries to facilitate the review of the field test data:

- Data almanacs document the use of response categories for each context questionnaire item as well each item's relationship with achievement
- Scale summaries detail each scale's reliability, dimensionality, fit to the Rasch model, and relationship with achievement

In June 2014, staff at the TIMSS \& PIRLS International Study Center reviewed the field test context questionnaire results, proposing revisions to the QIRC. At their 2 ${ }^{\text {nd }}$ meeting in July 2014, the QIRC accepted many of the recommendations and suggested a few additional changes. In August 2014 at their $5^{\text {th }}$ meeting, NRCs reviewed the final draft questionnaires and accepted the questionnaires with a few minor revisions. Following the NRC meeting, staff at the TIMSS \& PIRLS International Study Center implemented the revisions and posted the final TIMSS instruments on August 28, 2014, so that countries could begin the translation process.

## Developing the TIMSS 2015 Curriculum Questionnaires

The TIMSS Curriculum Questionnaires complement the student, teacher, school, and home questionnaires by collecting information from NRCs about country-level contexts. The Curriculum Questionnaires cover each country's mathematics and science curricula, goals and standards for instruction, and other national or regional policies such as the preprimary education process and the teacher education process.

Similar to the other TIMSS 2015 questionnaires, the process for updating the TIMSS Curriculum Questionnaires started with the TIMSS 2015 Context Questionnaire Framework. Then, NRCs and the QIRC identified the information from the TIMSS 2011 Curriculum Questionnaires that they thought was useful to continue collecting.

Based on the framework, and the NRC and QIRC feedback, staff at the TIMSS \& PIRLS International Study Center updated the TIMSS 2015 Curriculum Questionnaires for review by NRCs at their $6^{\text {th }}$ meeting in March 2015. Following the NRC meeting, staff at the TIMSS \& PIRLS International Study Center finalized the questionnaires, incorporating the suggestions that emerged from the meeting. NRCs completed the online Curriculum Questionnaires between April 23, 2015 and August 31, 2015.

## CHAPTER 3

## Sample Design in TIMSS 2015

## Sylvie LaRoche

Marc Joncas
Pierre Foy

## Introduction

TIMSS is designed to provide valid and reliable measurement of trends in student achievement in countries around the world, while keeping to a minimum the burden on schools, teachers, and students. The TIMSS program employs rigorous school and classroom sampling techniques so that achievement in the student population as a whole may be estimated accurately by assessing just a sample of students from a sample of schools. TIMSS assesses mathematics and science achievement at two grade levels and so TIMSS has two target populations-all students enrolled at the fourth grade and all students enrolled at the eighth grade. Countries may assess either or both student populations. In addition, for the TIMSS 2015 cycle, countries could participate in TIMSS Numeracy - a new, less difficult mathematics assessment at the fourth grade.

TIMSS employs a two-stage random sample design, with a sample of schools drawn as a first stage and one or more intact classes of students selected from each of the sampled schools as a second stage. Intact classes of students are sampled rather than individuals from across the grade level or of a certain age because TIMSS pays particular attention to students' curricular and instructional experiences, and these typically are organized on a classroom basis. Sampling intact classes also has the operational advantage of less disruption to the school's day-to-day business than individual student sampling.

## National Sampling Plan

Each country participating in TIMSS needs a plan for defining its national target population and applying the TIMSS sampling methods to achieve a nationally representative sample of schools and students. The development and implementation of the national sampling plan is a collaborative exercise involving the country's National Research Coordinator (NRC) and TIMSS sampling experts.

Statistics Canada is responsible for advising the National Research Coordinator on all sampling matters and for ensuring that the national sampling plan conforms to the TIMSS
standards. In cooperation with sampling staff from the IEA Data Processing and Research Center (IEA DPC), Statistics Canada works with the National Research Coordinator to select the national school sample(s) and produce all supporting documentation for tracking the sampled schools. This includes ensuring that the school sampling frame (the school population list from which the school sample is drawn) provided by the National Research Coordinator is complete and satisfactory; checking that categories of excluded students are clearly defined, justified, and kept to a minimum; assisting the National Research Coordinator in determining the sample size and a stratification plan that will meet both international and national objectives; and drawing a national sample of schools. When sampling has been completed and all data collected, Statistics Canada documents population coverage and school and student participation rates and constructs appropriate sampling weights for use in analyzing and reporting the results.

The TIMSS \& PIRLS International Study Center, in cooperation with Statistics Canada and the IEA DPC, provides National Research Coordinators with a series of manuals to guide them through the sampling process. More specifically, TIMSS 2015 Survey Operations Procedures Unit 1: Sampling Schools and Obtaining their Cooperation describes the steps involved in defining the national target population and selecting the school sample, and TIMSS 2015 Survey Operations Procedures Unit 3: Contacting Schools and Sampling Classes for Data Collection describes the procedure for sampling classes within the sampled schools and making preparations for conducting the assessments. Within-school sampling procedures for the field test are documented in TIMSS 2015 Survey Operations Procedures Unit 2: Preparing for and Conducting the Field Test. More information on the Survey Operations Units can be found in Chapter 6 of this volume.

The TIMSS National Research Coordinator is responsible for providing Statistics Canada with all information and documentation necessary to conduct the national sampling, and for conducting all sampling operations in the country. In particular, the NRC is expected to identify the grade(s) that correspond to the international target population(s); create a sampling frame by listing all schools in the population that have classes with students in the target grade(s); determine national population coverage and exclusions, in accordance with the TIMSS international guidelines; work with Statistics Canada to develop a national sampling plan and identify suitable stratification variables, ensuring that these variables are present and correct for all schools; contact all sampled schools and secure their participation; keep track of school participation and the use of replacement schools; and conduct all within-school sampling of classes. Each NRC is required to complete a series of sampling forms documenting the completion of each of these tasks.

A crucial feature of each international meeting of National Research Coordinators is a one-toone meeting between each NRC and sampling staff at Statistics Canada and the IEA DPC. At these meetings, each step of the sampling process is documented and reviewed in detail, and NRCs have the opportunity to raise issues and ask questions about their national situation and any challenges they face. Statistics Canada consults with the TIMSS \& PIRLS International Study Center and the

International Sampling Referee, as necessary, to resolve issues and questions. Final approval of TIMSS national sampling plans is the responsibility of the TIMSS \& PIRLS International Study Center, based upon the advice of Statistics Canada and the International Sampling Referee.

## Defining the Target Population

As an international study of the comparative effects of education on student achievement in mathematics and science, TIMSS defines its international target populations in terms of the amount of schooling students have received. The number of years of formal schooling is the basis of comparison among participating countries. Thus, the TIMSS international target population at the lower grade is all students in their fourth year of formal schooling, and at the upper grade, all students in their eighth year of formal schooling. Like TIMSS at the lower grade, the international target population for TIMSS Numeracy, is students in their fourth year of formal schooling. UNESCO's International Standard Classification of Education ISCED 2011 (ISCED, 2012) provides an internationally accepted classification scheme for describing levels of schooling across countries. The ISCED system describes the full range of schooling, from pre-primary (Level 0) to the doctoral level (Level 8). ISCED Level 1 corresponds to primary education or the first stage of basic education. The first year of Level 1 "coincides with the transition point in an education system where systematic teaching and learning in reading, writing and mathematics begins" (UNESCO, 2012, p. 30). Four years after this would be the target grade for fourth grade TIMSS including TIMSS Numeracy, and is the fourth grade in most countries. Similarly, eight years after the first year of ISCED Level 1 is the target grade for eighth grade TIMSS and is the eighth grade in most countries. However, given the cognitive demands of the assessments, TIMSS wants to avoid assessing very young students. Thus, TIMSS recommends assessing the next higher grade (i.e., fifth grade for fourth grade TIMSS and ninth grade for eighth grade TIMSS) if, for fourth grade students, the average age at the time of testing would be less than 9.5 years and, for eighth grade students, less than 13.5 years.

The fourth grade and eighth grade target populations of students are defined as follows:

- Fourth grade: All students enrolled in the grade that represents four years of schooling counting from the first year of ISCED Level 1, providing the mean age at the time of testing is at least 9.5 years
- Eighth grade: All students enrolled in the grade that represents eight years of schooling counting from the first year of ISCED Level 1, providing the mean age at the time of testing is at least 13.5 years

All students enrolled in the target grade, regardless of their age, belong to the international target population and should be eligible to participate in TIMSS. Because students are sampled in two stages, first by randomly selecting a school and then randomly selecting a class from within
the school, it is necessary to identify all schools in which eligible students are enrolled. Essentially, eligible schools for TIMSS are those that have any students enrolled in the target grade, regardless of type of school. All schools of all educational sub-systems that have students learning full-time in the target grade are part of the international target population, including schools that are not under the authority of the national Ministry of Education.

## National Target Populations

For most countries, the target grade for TIMSS is the fourth and/or eighth grade. However, because educational systems vary in structure and in policies and practices with regard to age of starting school and promotion and retention, there are differences across countries in how the target grades are labelled and in the average age of students. To ensure that the appropriate national target grades are selected, each NRC completes Sampling Form 1, which identifies the target grades, the country's name for those grades, and the average age of students in those grades at the time of data collection. An example of a completed Sampling Form 1 is presented in Exhibit 3.1.

Exhibit 3.1: Example of Sampling Form 1

## Sampling Form 1

## General Information

See Section 2 of TIMSS 2015 Survey Operations Procedures Unit 1

| TIMSS 2015 Participant : | $<$ Name of the Country > |
| :--- | :--- |
|  | <Name of the NRC > |
|  |  |

1. Please indicate the assessment(s) in which your country plans to participate along with the target grade(s), name(s), and expected average age of students at the time of testing:

|  | Target <br> Grade | Name of the Target Grade | Average Age |
| :---: | :---: | :--- | :--- |
|  | 4 | Primary 4 | 9.7 |
| TIMSS | 8 | Secondary 2 | 13.7 |
|  |  |  |  |
| TIMSS | 4 | Primary 4 |  |
| Numeracy |  |  | 9.7 |

2. Specify the usual start and end date(s) of the school year and the expected date(s) of testing for the data collection.

Start of school year : (YYYY-MM-DD)

3. Will you request that Statistics Canada and/or the IEA DPC select your school sample(s)? (Click in box and on right arrow to see drop down menu)
Please select Yes or No
4. Specify the language(s) in which the assessment(s) will be administered.

English
5. Describe the grade structure through ISCED Level 1 (primary education or the first stage of basic education) and ISCED Level 2 (basic or lower secondary education) in your country.

Grades 1 to 6 , Primary schools
Grades 7 to 9 , Lower secondary schools
6. Describe the age and birth date rules for entering ISCED Level 1 in your country.

Children must enter school (grade 1) in the autumn of the year in which they have their sixth birthday

## National Coverage and Exclusions

TIMSS is designed to describe and summarize student achievement across the entire target grade (fourth or eighth), and so it is very important that national target populations aim for comprehensive coverage of eligible students. However, in some cases, political, organizational, or operational factors make complete national coverage difficult to attain. Thus, in some rare situations, certain groups of schools and students may have to be excluded from the national target population. For example, it may be that a particular geographical region, educational sub-system, or language group cannot be covered. Such exclusion of schools and students from the target population is referred to as reduced population coverage.

Even countries with complete population coverage find it necessary to exclude at least some students from the target population because they attend very small schools, have intellectual or functional disabilities, or are non-native language speakers. Such students may be excluded at the school level (i.e., the whole school is excluded) or within the school on an individual basis.

School Level Exclusions. Although it is expected that very few schools will be excluded from the national target population, NRCs are permitted to exclude schools on the following grounds when they consider it necessary:

- Inaccessibility due to their geographically remote location
- Extremely small size (e.g., four or fewer students in the target grade)
- Offering a grade structure, or curriculum, radically different from the mainstream educational system
- Providing instruction solely to students in the student-level exclusion categories listed below (e.g., catering only to special needs students)

Student Level Exclusions. The international within-school exclusion rules are specified as follows:

- Students with functional disabilities - These are students who have physical disabilities such that they cannot perform in the TIMSS testing situation. Students with functional disabilities who are able to perform should be included in the testing.
- Students with intellectual disabilities - These are students who are considered, in the professional opinion of the school principal or by other qualified staff members, to have intellectual disabilities or who have been tested as such. This includes students who are emotionally or mentally unable to follow even the general instructions of the test. Students should not be excluded solely because of poor academic performance or normal disciplinary problems. It should be noted that students with dyslexia, or other such learning disabilities, should be accommodated in the test situation if possible, rather than excluded.
- Non-native language speakers - These are students who are unable to read or speak the language(s) of the test and would be unable to overcome the language barrier in the test situation. Typically, a student who has received less than one year of instruction in the language(s) of the test should be excluded.

Because disability criteria vary from country to country, NRCs are asked to translate the TIMSS international exclusion standards into the local equivalent. Students should be considered for exclusion strictly in accordance with the international standards. If a sampled school contains a class consisting entirely of students from one of the exclusion categories, such a class is excluded prior to classroom sampling.

NRCs understand that exclusion rates must be kept to a minimum in order that national samples accurately represent the national target population.

- The overall number of excluded students must not account for more than $5 \%$ of the national target population of students in a country. The overall number includes both school-level and within-school exclusions.
- The number of students excluded because they attend very small schools must not account for more than $2 \%$ of the national target population of students.

To document population coverage and exclusions, each NRC completes Sampling Form 2, which lists the number of students in the national target population and the number of students excluded at both the school level and within the school for each population to be assessed. An example of a completed Sampling Form 2 is presented in Exhibit 3.2.

Exhibit 3.2: Example of Sampling Form 2

## Requirements for Sampling the Target Population

TIMSS sets high standards for sampling precision, participation rates, and sample implementation in order to achieve national samples of the highest quality and survey estimates that are unbiased, accurate and internationally comparable.

## Sampling Precision and Sample Size

Because TIMSS is fundamentally a study of student achievement, the precision of estimates of student achievement is of primary importance. To meet the TIMSS standards for sampling precision, national student samples should provide for a standard error no greater than .035 standard deviation units for the country's mean achievement. With a standard deviation of 100 on the TIMSS achievement scales, this standard error corresponds to a $95 \%$ confidence interval of $\pm 7$ score points for the achievement mean and of $\pm 10$ score points for the difference between achievement means from successive cycles (e.g., the difference between a country's achievement mean on TIMSS 2011 and TIMSS 2015). Sample estimates of any student-level percentage estimate (e.g., a student background characteristic) should have a confidence interval of $\pm 3.5 \%$.

For most countries, the TIMSS precision requirements are met with a school sample of 150 schools and a student sample of 4,000 students for each target grade. Depending on the average class size in the country, one class from each sampled school may be sufficient to achieve the desired student sample size. For example, if the average class size in a country were 27 students, a single class from each of 150 schools would provide a sample of 4,050 students (assuming full participation by schools and students). Some countries choose to sample more than one class per school, either to increase the size of the student sample or to provide a better estimate of schoollevel effects.

For countries choosing to participate in both TIMSS at the fourth grade and TIMSS Numeracy, the required student sample size is doubled - i.e., around 8000 sampled students. Countries could choose to select more schools or more classes within sampled schools to achieve the required sample size.

A school sample larger than the minimum of 150 schools may be required under the following circumstances:

- The average class size in a country is so small that, even when sampling more than one classroom per school, it is not possible to reach the student sample size requirements by selecting only 150 schools
- Previous cycles of TIMSS showed that the sampling precision requirements cannot be met unless a larger school sample is selected
- Classes within schools are tracked by student performance (more common at eighth grade than at fourth grade). This increases variation between classes in student achievement and can reduce sampling precision. In this situation, it is advisable to sample at least two classrooms per school whenever possible, in addition to sampling more schools.
- A high level of non-response is anticipated, leading to sample attrition and reduced sample size. Note that while a larger school sample helps to maintain sample size in the face of non-response, it does not compensate for non-response bias.

## Field Test Sample

The school sample for the TIMSS field test is drawn at the same time and from the same population of schools as the full sample. The field test sample size requirement is 200 students per field test achievement booklet. The total field test sample size is a function of the number of achievement booklets being field tested. Typically, TIMSS has six field test booklets and so requires a field test sample of 1200 students at each grade. For TIMSS 2015, TIMSS Numeracy field tested five field test booklets and therefore required a sample size of 1000 students. As such, countries participating in both TIMSS and TIMSS Numeracy at fourth grade required a field test size of 2200 students.

## Participation Rates

To minimize the potential for non-response bias, TIMSS aims for $100 \%$ participation by sampled schools, classrooms, and students, while recognizing that some degree of non-participation may be unavoidable. For a national sample to be fully acceptable it must have either:

- A minimum school participation rate of $85 \%$, based on originally sampled schools AND
- A minimum classroom participation rate of $95 \%$, from originally sampled schools and replacement schools AND
- A minimum student participation rate of $85 \%$, from sampled schools and replacement schools
OR
- A minimum combined school, classroom, and student participation rate of $75 \%$, based on originally sampled schools (although classroom and student participation rates may include replacement schools)
Classrooms with less than $50 \%$ student participation are deemed to be not participating.

## Developing and Implementing the National Sampling Plan

Although National Research Coordinators are responsible for developing and implementing national sampling plans, Statistics Canada and the IEA DPC work closely with NRCs to help ensure that these sampling plans fully meet the standards set by the TIMSS \& PIRLS International Study Center, while also adapting to national circumstances and requirements. National sampling plans must be based on the international two-stage sample design (schools as the first stage and classes within schools as the second stage) and must be approved by Statistics Canada.

## TIMSS Stratified Two-Stage Cluster Sample Design

The basic international sample design for TIMSS is a stratified two-stage cluster sample design, as follows:

First Sampling Stage. For the first sampling stage, schools are sampled with probabilities proportional to their size (PPS) from the list of all schools in the population that contain eligible students. The schools in this list (or sampling frame) may be stratified (sorted) according to important demographic variables. Schools for the field test and data collection are sampled simultaneously using a systematic random sampling approach. Two replacement schools are also pre-assigned to each sampled school during the sample selection process, and these replacement schools are held in reserve in case the originally sampled school refuses to participate. Replacement schools are used solely to compensate for sample size losses in the event that the originally sampled school does not participate. School sampling is conducted for each country by Statistics Canada with assistance from the IEA DPC, using the sampling frame provided by the country's National Research Coordinator.

Second Sampling Stage. The second sampling stage consists of the selection of one (or more) intact class from the target grade of each participating school. Class sampling in each country is conducted by the National Research Coordinator using the Within-School Sampling Software (WinW3S) developed by the IEA DPC and Statistics Canada. Having secured a sampled school's agreement to participate in the assessment, the NRC requests information about the number of classes and teachers in the school and enters it in the WinW3S database. Classes smaller than a specified minimum size are grouped into pseudo-classes prior to sampling. The software selects classes with equal probabilities within schools. All students in each sampled class participate in the assessment. Sampled classes that refuse to participate may not be replaced.

For countries participating in both TIMSS at the fourth grade and TIMSS Numeracy, students within a sampled class are randomly assigned either a TIMSS or TIMSS Numeracy booklet through a booklet rotation system. This is done to ensure that TIMSS and TIMSS Numeracy are administered to probabilistically equivalent samples.

## Stratification

Stratification consists of arranging the schools in the target population into groups, or strata, that share common characteristics such as geographic region or school type. Examples of stratification variables used in TIMSS include region of the country (e.g., states or provinces); school type or source of funding (e.g., public or private); language of instruction; level of urbanization (e.g., urban or rural area); socioeconomic indicators; and school performance on national examinations.

In TIMSS, stratification is used to:

- Improve the efficiency of the sample design, thereby making survey estimates more reliable
- Apply different sample designs, such as disproportionate sample allocations, to specific groups of schools (e.g., those in certain states or provinces)
- Ensure proportional representation of specific groups of schools in the sample

School stratification can take two forms: explicit and implicit. In explicit stratification, a separate school list or sampling frame is constructed for each stratum and a sample of schools is drawn from that stratum. In TIMSS, the major reason for considering explicit stratification is disproportionate allocation of the school sample across strata. For example, in order to produce equally reliable estimates for each geographic region in a country, explicit stratification by region may be used to ensure the same number of schools in the sample for each region, regardless of the relative population size of the regions.

Implicit stratification consists of sorting the schools by one or more stratification variables within each explicit stratum, or within the entire sampling frame if explicit stratification is not used. The combined use of implicit strata and systematic sampling is a very simple and effective way of ensuring a proportional sample allocation of students across all implicit strata. Implicit stratification also can lead to improved reliability of achievement estimates when the implicit stratification variables are correlated with student achievement.

National Research Coordinators consult with Statistics Canada and the IEA DPC to identify the stratification variables to be included in their sampling plans. The school sampling frame is sorted by the stratification variables prior to sampling schools so that adjacent schools are as similar as possible. Regardless of any other explicit or implicit variables that may be used, the school size is always included as an implicit stratification variable.

To document the stratification variables used in their sampling plans, each NRC completes Sampling Form 3, which lists the variables to be used for explicit and implicit stratification, and the number of levels of each stratification variable. An example of a completed Sampling Form 3 is presented in Exhibit 3.3. Appendix 3A provides the list of explicit and implicit stratification variables implemented by the countries participating at the fourth grade and Appendix 3B provides the equivalent list for eighth grade. Further details on the explicit and implicit stratification variables for each country can be found in the Characteristics of National Samples section in Chapter 5: Sampling Implementation.

TIMSS 2015

## School Sampling Frame

One of the National Research Coordinator's most important sampling tasks is the construction of a school sampling frame for the target population. The sampling frame is a list of all schools in the country that have students enrolled in the target grade, and is the list from which the school sample is drawn. A well-constructed sampling frame provides complete coverage of the national target population without being contaminated by incorrect or duplicate entries or entries that refer to elements that are not part of the defined target population.

A suitable school measure of size (MOS) is a critical aspect of the national sampling plan, because the size of a school determines its probability of selection. The most appropriate school measure of size is an up-to-date count of the number of students in the target grade. If the number of students in the target grade is not available, total student enrollment in the school may be the best available substitute.

Sampling Form 4, presented in Exhibit 3.4, provides some basic information about the school sampling frame, including the average class size at the target grade, the number of classrooms to be sampled per school, the school measure of size (MOS) to be used for school sampling, and the school year from which the frame was constructed.

Exhibit 3.4: Example of Sampling Form 4

The school sampling frame is usually a spreadsheet containing a single entry for each school. This entry includes a unique identification number and contact information (if appropriate given the country's privacy laws), the values of the stratification variables for the school, and the school measure of size. It is useful if the school entry also includes the number of classes in the school in the target grade because this provides a mechanism for predicting in advance the size of the eventual student sample. This predicted sample size may be compared with the eventual student sample size as a check on the sampling process.

Exhibit 3.5 provides an example of a partial sampling frame for a country assessing TIMSS 2015 at the eighth grade. In this example, region and urbanization could be used as stratification variables.

## Sampling Schools

Once the school sampling frame is structured to meet all international and national requirements, Statistics Canada can draw the school sample. If the sampling frame is explicitly stratified, it is necessary to decide how the school sample is to be allocated among the explicit strata (i.e., the number of schools to be sampled in each stratum). When this has been decided, a sample of schools is selected within each explicit stratum using systematic sampling with probabilities proportional to size. The PPS technique means that the larger schools, those with more students, have a higher probability of being sampled than the smaller schools. However, this difference in the selection probabilities of larger and smaller schools is largely offset at the second stage of sampling by
selecting a fixed number of classes (usually one or two) with equal probability from the sampled school. Classes in large schools with many classes at the target grade have a lower probability of selection than classes in smaller schools that have just one or two classes. A description of the school sampling procedure is provided in Appendix 3C.

Even though the field test is scheduled in the school year before the year of data collection in most countries, the preferred approach in TIMSS is to select both samples of schools at the same time. This ensures that both the field test and data collection samples constitute random samples representative of all schools in the country, and that no school is selected for both samples.

Replacement Schools. Ideally, all schools sampled for TIMSS should participate in the assessments, and NRCs work hard to achieve this goal. Nevertheless, it is anticipated that a 100 percent participation rate may not be possible in all countries. To avoid sample size losses, the sampling plan identifies, a priori, specific replacement schools for each sampled school. Each originally sampled school has two pre-assigned replacement schools, usually the school immediately preceding the originally sampled school on the school sampling frame and the one immediately following it. Replacement schools always belong to the same explicit stratum as the original but may come from different implicit strata if the school they are replacing is either the first or last school of an implicit stratum.

The main justification for replacement schools in TIMSS is to ensure adequate sample sizes for analysis of subpopulation differences. Although the use of replacement schools does not eliminate the risk of bias due to school nonparticipation, employing implicit stratification and ordering the school sampling frame by school size increases the chances that a sampled school's replacements would have similar characteristics. This approach maintains the desired sample size while restricting replacement schools to strata where nonresponse occurs. Since the school frame is ordered by school size, replacement schools also tend to be similar in size to the school they are designated to replace.

NRCs understand that they should make every effort to secure the participation of all of the sampled schools. Only after all attempts to persuade a sampled school to participate have failed is the use of its replacement school considered.

## Common Adjustments to the TIMSS School Sampling Design

TIMSS school sample design offers considerable flexibility in allowing countries to maximize or minimize the extent to which the same schools are assessed. In order to increase operational efficiency, some countries that administer TIMSS at both the fourth and eighth grades, where fourth and eighth graders attend the same school, find it more efficient to administer TIMSS at the same school for both grades. In other cases, countries try to ensure that assessments are spread across schools and therefore prefer that TIMSS at the fourth and eighth grades are not administered at the same school and/or that TIMSS sampling avoid, when possible, selecting schools that have
recently administered other national and international assessments. To provide flexibility to meet these requests, Statistics Canada implements modified sampling procedures-the details of which are described in Appendix 3D.

## Sampling Classes

Within each sampled school, all classes with students at the target grade are listed, and one or more intact classes are selected with equal probability of selection using systematic random sampling. This procedure is implemented using the WinW3S sampling software. The selection of classes with equal probability, combined with the PPS sampling method for schools, in general results in a self-weighting student sample. If the school has multi-grade classes (i.e., the class contains students from more than one grade level), only students from the target grade are eligible for sampling.

When a country participates in both TIMSS and TIMSS Numeracy at fourth grade, students within the sampled classes are randomly assigned to one study or the other by rotating the TIMSS and TIMSS Numeracy booklets within the sampled classes. This is done automatically by the WinW3S software.

Because small classes tend to increase the risk of unreliable survey estimates and can lead to reduced overall student sample size, it is necessary to avoid sampling too many small classes. Based on consideration of the size distribution of classes and the average class size, a lower class size limit or minimum class size (MCS) is specified for each country. Prior to sampling classes in a school, any class smaller than the MCS is combined with another class in the school to form a pseudoclass for sampling purposes. The procedure for sampling classes within schools is described in more detail in the Survey Operations Procedures chapter of this volume.

## Sampling Weights

National student samples in TIMSS are designed to accurately represent the target populations within a specified margin of sampling error, as described previously. After the data have been collected and processed, sample statistics such as means and percentages that describe student characteristics are computed as weighted estimates of the corresponding population parameters, where the weighting factor is the sampling weight. A student's sampling weight is essentially the inverse of the student's probability of selection, with appropriate adjustments for nonresponse. In principle, the stratified two-stage sampling procedure used in TIMSS, where schools are sampled with probability proportional to school size and classes are sampled with probability inversely proportional to school size, provides student samples with equal selection probabilities. However, in practice disproportionate sampling across explicit strata by varying the number of classes selected and differential patterns of nonresponse can result in varying selection probabilities, requiring a unique sampling weight for the students in each participating class in the study.

The student sampling weight in TIMSS is a combination of weighting components reflecting selection probabilities and sampling outcomes at three levels-school, class, and student. At each level, the weighting component consists of a basic weight that is the inverse of the probability of selection at that level, together with an adjustment for nonparticipation. The overall sampling weight for each student is the product of the three weighting components: school, class (within school), and student (within class).

Note that sampling weights are calculated independently for each grade and each study. In general, a country will have only one set of sampling weights per target population (fourth and/ or eighth grade). However, with the introduction of TIMSS Numeracy in 2015, a country that participates in both TIMSS and TIMSS Numeracy would have two sets of sampling weights at fourth grade as sampling weights are calculated separately for TIMSS and TIMSS Numeracy.

## School Weighting Component

Given that schools in TIMSS are sampled with probability proportional to school size, the basic school weight for the $i^{\text {th }}$ sampled school (i.e., the inverse of the probability of the $i^{\text {th }}$ school being sampled) is defined as:

$$
B W_{s c}^{i}=\frac{M}{n \cdot m_{i}}
$$

where $n$ is the number of sampled schools, $m_{i}$ is the measure of size for the $i^{\text {th }}$ school, and

$$
M=\sum_{i=1}^{N} m_{i}
$$

where $N$ is the total number of schools in the explicit stratum. ${ }^{1}$
School Nonparticipation Adjustment. If a sampled school does not participate in TIMSS and its two designated replacement schools do not participate, it is necessary to adjust the basic school weight to compensate for the reduction in sample size. The school-level nonparticipation adjustment is calculated separately for each explicit stratum, as follows:

$$
A_{s c}=\frac{n_{s}+n_{r 1}+n_{r 2}+n_{n r}}{n_{s}+n_{r 1}+n_{r 2}}
$$

where $n_{s}$ is the number of originally sampled schools that participated, $n_{r 1}$ and $n_{r 2}$ the number of first and second replacement schools, respectively, that participated, and $n_{n r}$ is the number of schools that did not participate. Sampled schools that are found to be ineligible ${ }^{2}$ are not included in the calculation of this adjustment.

Combining the basic school weight and the school nonparticipation adjustment, the final school weighting component for the $i^{\text {th }}$ school becomes:

$$
F W_{s c}^{i}=A_{s c} \cdot B W_{s c}^{i}
$$

It should be noted that, as well as being a crucial component of the overall student weight, the final school weighting component is a sampling weight in its own right, and can be used in analyses where the school is the analytic unit.

## Class Weighting Component

The class weighting component reflects the class-within-school selection probability. After a school has been sampled and has agreed to participate in TIMSS, one or two classes are sampled with equal probability from the list of all classes in the school at the target grade. Because larger schools have more classes from which to sample than smaller schools, the probability of class selection varies with school size, with students in small schools more likely to have their class selected than students in large schools. This relatively greater selection probability for students in small schools offsets their lower selection probability at the first stage, where probability-proportional-to-size school sampling results in higher selection probabilities for larger schools.

The basic class-within-school weight for a sampled class is the inverse of the probability of the class being selected from all of the classes in its school. For the $i^{\text {th }}$ sampled school, let $C^{i}$ be the total number of eligible classes and $c^{i}$ the number of sampled classes. Using equal probability sampling, the basic class weight for all sampled classes in the $i^{\text {th }}$ school is:

$$
B W_{c l}^{i}=\frac{C^{i}}{c^{i}}
$$

For most TIMSS participants, $c^{i}$ takes the values 1 or 2.
Class Nonparticipation Adjustment. Basic class weights are calculated for all sampled classes in the sampled and replacement schools that participate in TIMSS. A class-level nonparticipation adjustment is applied to compensate for classes that do not participate or where the student participation rate is below 50 percent. ${ }^{3}$ Such sampled classes are assigned a weight of zero. Class nonparticipation adjustments are applied at the explicit stratum level rather than at the school level to minimize the risk of bias. The adjustment is calculated as follows:

$$
A_{c l}=\frac{\sum_{i}^{s+1} 1}{\sum_{i}^{s+r+2} \delta_{i} / c^{i}}
$$

3 Although sampling weights are calculated separately for each study when countries participate in both TIMSS and TIMSS Numeracy at fourth grade, the criteria to evaluate if student participation within a class is below $50 \%$ uses the student participation from both studies combined. Therefore, if $50 \%$ or more students from a class participated in either TIMSS or TIMSS Numeracy, the class is considered as participating when calculating sampling weights for TIMSS or TIMSS Numeracy.
where $c^{i}$ is the number of sampled classes in the $i^{\text {th }}$ school, as defined earlier, and $\delta_{i}$ gives the number of participating classes in the $i^{\text {th }}$ school.

Combining the basic class weight and the class nonparticipation adjustment, the final class weighting component, assigned to all sampled classes in the $i^{\text {th }}$ school, becomes:

$$
F W_{c l}^{i, j}=A_{c l} \cdot B W_{c l}^{i}
$$

## Student Weighting Component

The student weighting component represents the student-within-class selection probability. The basic student weight is the inverse of the probability of a student in a sampled class being selected.

In the typical TIMSS situation where intact classes are sampled, all students in the class are included, and so this probability is unity. However, under certain circumstances, students may be sampled within the class, and in these circumstances the probability is less than unity. For TIMSS 2015, within-class sampling occurred in countries that decided to administer both TIMSS and TIMSS Numeracy at the fourth grade.

For an intact class with no student subsampling, the basic student weight for the $j^{\text {th }}$ class in the $i^{\text {th }}$ school is computed as follows:

$$
B W_{s t 1}^{i, j}=1.0
$$

For classes with student subsampling, the basic student weight for the $j^{\text {th }}$ class in the $i^{\text {th }}$ school is:

$$
B W_{s t 2}^{i j}=\frac{n_{r g}^{i, j}+n_{b s}^{i, j}}{n_{r g}^{i, j}}
$$

where $n_{r g}^{i, j}$ is the number of students in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school selected to participate in TIMSS and $n_{b s}^{i, j}$ is the number of students in the class not selected. In the case of countries administering both TIMSS and TIMSS Numeracy at fourth grade, a set of weights is calculated for each study and the basic student weight is calculated differently, as the participation status is known for all the students in each sampled class. In this case, the basic student weight for the $j^{\text {th }}$ class in the $i^{\text {th }}$ school for study $k$ is given by:

$$
B W_{s t 3}^{i j}=\left\{\begin{array}{c}
1, \quad \text { For students who left school or were excluded, } \\
\frac{n_{r g^{\prime}}^{i, j}+n_{b s}^{i, j}}{n_{r g^{\prime}}^{i, j}},
\end{array} \text { For all other students selected for study } k\right.
$$

where $k$ represents either TIMSS or TIMSS Numeracy, $n_{r g^{\prime}}^{i, j}$ and $n_{b s^{\prime}}^{i, j}$ represent the number of students in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school selected to participate in study $k$ and the number of
students in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school not selected for study $k$ respectively, without counting students who either were excluded or left school after the class listing was completed.

Adjustment for Non-Participation. The student nonparticipation adjustment for the $j^{\text {th }}$ classroom in the $i^{\text {th }}$ school is calculated as:

$$
A_{s t 1}^{i, j}=A_{s t 2}^{i, j}=A_{s t 3}^{i, j}=\frac{s_{r s}^{i, j}+s_{n r}^{i, j}}{s_{r s}^{i, j}}
$$

where $s_{r s}^{i, j}$ is the number of participating students (i.e., students that participated in TIMSS or TIMSS Numeracy and have assessment scores) in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school and $s_{n r}^{i, j}$ is the number of students sampled in this class who were expected to have assessment scores but did not participate in the assessment. For intact classes, the sum of $s_{r s}^{i, j}$ and $s_{r r}^{i, j}$ is the total number of students listed in the class, not counting excluded students or students who have left the school since class list was published.

The final student weighting component for students in the $j^{\text {th }}$ classroom of the $i^{\text {th }}$ school is:

$$
F W_{s t}^{i, j}=A_{s t \Delta}^{i, j} \cdot B W_{s t \Delta}^{i, j}
$$

where $\Delta$ equals 1 when there was no student subsampling (intact classes), 2 when a sample of students was drawn from the students in the class and 3 when both TIMSS and TIMSS Numeracy were administered at fourth grade within the same schools and classes.

Overall Student Sampling Weight. The overall student sampling weight is the product of the final weighting components for schools, classes, and students, as follows:

$$
W^{i, j}=F W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}
$$

Overall student sampling weights are only attributed to participating students, with nonparticipants weighted at 0 . All student data reported in the TIMSS international reports are weighted by the overall student sampling weight, known as TOTWGT in the TIMSS international databases.

## Participation Rates

Because nonparticipation can result in sample bias and misleading results, it is important that the schools, classes, and students that are sampled to participate in TIMSS actually take part in the assessments. To show the level of sampling participation in each country, TIMSS calculates both unweighted participation rates (i.e., based on simple counts of schools, classes, and students) and weighted participation rates based on the sampling weights described in the previous section. Unweighted participation rates provide a preliminary indicator that may be used to monitor
progress in securing the participation of schools and classes, whereas weighted participation rates are the ultimate measure of sampling participation.

TIMSS reports weighted and unweighted participation rates for schools, classes, and students, as well as overall participation rates that are a combination of all three. To distinguish between participation based solely on originally sampled schools and participation that also relies on replacement schools, school and overall participation rates are computed separately for originally sampled schools only and for originally sampled together with replacement schools.

## Unweighted School Participation Rate

The unweighted school participation rate is the ratio of the number of participating schools to the number of originally sampled schools, excluding any sampled schools found to be ineligible. A school is considered to be a participating school if at least one of its sampled classes has a student participation rate of at least 50 percent. The two unweighted school participation rates are calculated as follows:
$R_{\text {unnw }}^{s c-s}=$ unweighted school participation rate for originally sampled schools only
$R_{u n v}^{s c-r}=$ unweighted school participation rate, including originally sampled and first and second replacement schools

$$
\begin{aligned}
& R_{u n w}^{s c-s}=\frac{n_{s}}{n_{s}+n_{r 1}+n_{r 2}+n_{n r}} \\
& R_{u n w}^{s c-r}=\frac{n_{s}+n_{r 1}+n_{r 2}}{n_{s}+n_{r 1}+n_{r 2}+n_{n r}}
\end{aligned}
$$

## Unweighted Class Participation Rate

The unweighted class participation rate is the ratio of the number of sampled classes that participated to the number of classes sampled, as follows:

$$
R_{u n w}^{c l}=\frac{\sum_{i}^{s+1+1+2} c_{*}^{i}}{\sum_{i}^{s+r+1+2} c^{i}}
$$

where $c^{\mathrm{i}}$ is the number of sampled classes in the $i^{\text {th }}$ school, and $c_{\neq}^{i}$ is the number of participating classes in the $i^{\text {th }}$ school. Both summations are across all participating schools.

## Unweighted Student Participation Rate

The unweighted student participation rate is the ratio of the number of selected students that participated in TIMSS to the total number of selected students that should have been assessed in the participating schools and classes. Classes where less than 50 percent of the students participate are considered to be not participating, and so students in such classes also are considered to be nonparticipants. ${ }^{4}$ The unweighted student participation rate is computed as follows:

$$
R_{u n w}^{s t}=\frac{\sum_{i, j} s_{r s}^{i, j}}{\sum_{i, j} s_{r s}^{i, j}+\sum_{i, j} s_{n r}^{i, j}}
$$

## Overall Unweighted Participation Rate

The overall unweighted participation rate is the product of the unweighted school, class, and student participation rates. Because TIMSS computes two versions of the unweighted school participation rate, one based on originally sampled schools only and the other including replacements as well as originally sampled schools, there also are two overall unweighted participation rates:
$R_{u n w}^{o v-s}=$ unweighted overall participation rate for originally sampled schools only
$R_{u n w}^{o v-r}=$ unweighted overall participation rate, including originally sampled and first and second replacement schools

$$
\begin{aligned}
& R_{u n w}^{o v-s}=R_{u n w}^{s c-s} \cdot R_{u n w}^{c l} \cdot R_{u n w}^{s t} \\
& R_{u n w}^{o v-r}=R_{u n w}^{s c-r} \cdot R_{u n w}^{c l} \cdot R_{u n w}^{s t}
\end{aligned}
$$

## Weighted School Participation Rate

The weighted school participation rate is the ratio of two estimates of the size of the target student population. The numerator is derived from the measure of size of those sampled schools that participated in TIMSS and the denominator is the weighted estimate of the total student enrollment in the population. Weighted school participation rates are computed for originally sampled schools and for originally sampled and replacement schools combined, as follows:
$R_{w t d}^{s c-s}=$ weighted school participation rate for originally sampled schools only
$R_{w t d}^{s c-r}=$ weighted school participation rate, including originally sampled and first and second replacement schools

$$
\begin{aligned}
& R_{w t d}^{s c-s}= \frac{\sum_{i, j}^{s} B W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}{s+r 1+r 2} F W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j} \\
& \sum_{i, j} \\
& R_{w t d}^{s c-r}= \frac{\sum_{i, j}^{s+r+r 2} B W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}{\sum_{i, j}^{s+r+r 2} F W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}
\end{aligned}
$$

Summations in both the numerator and denominator are over all responding students and include appropriate class and student sampling weights. Note that the basic school weight appears in the numerator, whereas the final school weight appears in the denominator.

## Weighted Class Participation Rate

The weighted class participation rate is computed as follows:

$$
R_{w t d}^{s t}=\frac{\sum_{i, j}^{s+r 1+r 2} B W_{s c}^{i} \cdot B W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}{\sum_{i, j}^{s+r 1+r 2} B W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}
$$

where both the numerator and denominator are summations over all responding students from classes with at least 50 percent of their students participating in the study, and the appropriate student-level sampling weights are used. In this formula, the basic class weight appears in the numerator, whereas the final class weight appears in the denominator. And, the denominator in this formula is the same quantity that appears in the numerator of the weighted school participation rate for all schools, whether originally sampled or replacement.

## Weighted Student Participation Rate

The weighted student participation rate is computed as follows:

$$
R_{w t d}^{s t}=\frac{\sum_{i, j}^{s+r 1+r 2} B W_{s c}^{i} \cdot B W_{c l}^{i, j} \cdot B W_{s t}^{i, j}}{\sum_{i, j}^{s+r 1+r 2} B W_{s c}^{i} \cdot B W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}
$$

where both the numerator and denominator are summations over all responding students from participating schools. In this formula, the basic student weight appears in the numerator, whereas the final student weight appears in the denominator. Also, the denominator in this formula is the same quantity that appears in the numerator of the weighted class participation rate for all participating schools, whether originally sampled or replacement.

## Overall Weighted Participation Rate

The overall weighted participation rate is the product of the weighted school, class, and student participation rates. Because there are two versions of the weighted school participation rate, one based on originally sampled schools only and the other including replacement as well as originally sampled schools, there also are two overall weighted participation rates:
$R_{w t d}^{o v-s}=$ weighted overall participation rate for originally sampled schools only
$R_{w t d}^{o v-r}=$ weighted overall participation rate, including sampled, first and second replacement schools

$$
\begin{aligned}
& R_{w t d}^{o v-s}=R_{w t d}^{s c-s} \cdot R_{w t d}^{c l} \cdot R_{w t d}^{s t} \\
& R_{w t d}^{o v-r}=R_{w t d}^{s c-r} \cdot R_{w t d}^{c l} \cdot R_{w t d}^{s t}
\end{aligned}
$$

Weighted school, class, student, and overall participation rates are computed for each TIMSS participant using these procedures.

## Appendix 3C: Sampling Schools

TIMSS employs random-start fixed-interval systematic sampling to draw the school sample, with each school selected with probability proportional to its size (PPS).

To sample schools using the PPS systematic sampling method, the schools from each explicit stratum in the sampling frame are sorted by implicit stratification variables and by their measure of size (MOS), as shown in the example. The MOS is accumulated from school to school and the running total (the Cumulative MOS) is listed next to each school. The cumulative MOS across the entire stratum (the Total Measure of Size) is a measure of the size of the school population in the stratum ( 59,614 students in the example).

## First Step: Compute the Sampling Interval

Dividing the Total MOS by the number of schools required for the sample (50 in the example) gives the sampling interval.

- $\mathbf{5 9 , 6 1 4} \div \mathbf{5 0}=\mathbf{1 , 1 9 2 . 2 8 0 0}$

## Second Step: Generate a Random Start

Generate a random number from a uniform $(0,1)$ distribution and multiply it by the sampling interval. The school whose cumulative MOS contains the resulting number is the first school in the sample.

- $0.5481 \times 1,192.2800=653.4887$
- School 1718, with cumulative MOS of 690 , is the first school in the sample.

## Third Step: Identify the Next School in the Sample (repeat until all schools have been sampled)

- Add the sampling interval to the number computed in the previous step.
- $653.4887+1,192.2800=1,845.7687$
- School 0067, with cumulative MOS of $\mathbf{1 , 8 5 5}$, is the second school in the sample.
- Repeat until all schools have been sampled. For example, to identify the third school:
- $\mathbf{1 , 8 4 5 . 7 6 8 7}+\mathbf{1 , 1 9 2 . 2 8 0 0}=\mathbf{3 , 0 3 8 . 0 4 8 7}$
- School 0333, with cumulative MOS of $\mathbf{3 , 0 3 8}$, is the third school in the sample.

## Fourth Step: Identify Replacement Schools

Two replacement schools are identified for each sampled school. The first replacement (R1) is the school that immediately follows the sampled school in the sampling frame, and the second replacement (R2) the school that immediately precedes the sampled school.

TIMSS

PPS Systemic Sampling—Schools

| Sampling Parameters |  |
| :---: | :---: |
| Total Number of schools: | 2,119 |
| Total Measure of Size: | 59,614 |
| School Sample Size: | 50 |
| Sampling Interval: | 1,192.2800 |
| Random Start: | 653.4887 |
| First Step |  |
| Compute the Sampling Interval: |  |
| $59,6914 \div 50=1,192.2800$ |  |
| Second Step |  |
| Generate a random start: |  |
| $0.5481 \times 1,192.2800=653.4887$ |  |
| Third Step (repeat until complete) |  |
| Compute the next selection numbers: |  |
| $653.4887+1,192.2800=1,845.7687$ |  |
| 1,845.7687 $+1,192.2800=3,038.0487$ |  |

## Appendix 3D: School Sampling Design Options to Accommodate Other Samples

TIMSS provides optional modifications to its sampling design for countries that want to maximize or minimize sampling overlap between schools sampled by TIMSS at the fourth and eighth grades as well as for countries that want to minimize overlap between schools sampled for TIMSS and schools sampled for other national or international assessments.

To provide options for countries in designing their school samples, Statistics Canada implemented two special sampling procedures. Method A was applied when data collection occurred simultaneously for two or more populations (as was the case in 2015 with TIMSS at fourth grade and eighth grades) and the country wanted to control the overlap between the schools. Method B was used primarily to ensure that the TIMSS samples avoided schools sampled for other studies, and also used when Method A was not appropriate.

## Sampling Method A: Sampling Modifications for Simultaneous Data Collection

This procedure stratifies the school population according to whether schools contain students from both populations to be sampled (fourth and eighth grades, for example), or students from one population only (fourth grade only or eighth grade only) as a way of controlling sample overlap. Each school is assigned a measure of size (MOS) based on the number of students in the two populations combined (i.e., fourth grade and eighth grade combined). Schools are sampled according to the sampling design described in this chapter. When selecting schools from strata comprising students from both populations, a country can choose to maximize or minimize the number of schools to be sampled at each grade level.

The example below shows a hypothetical country participating in TIMSS at both grades. For reasons of administrative efficiency, the country wants to maximize the overlap between the fourth and eighth grade school samples. The 8,805 schools from the combined school frames (fourth and eighth grades) were first split in three strata and then a school sample of 164 was drawn as shown in the accompanying table.

Method A: Allocation of School Samples in a Country Participating at Two Grade Levels

|  | Total |  |  |
| :--- | :---: | :---: | :---: |
| Overlap Strata |  | To TIMSS <br> Grade 4 | To TIMSS <br> Grade 8 |
|  | 14 | 14 | 0 |
| Grade 4 only | 14 | 0 | 14 |
| Grade 8 only | 136 | 136 | 136 |
| Grade 4 \& Grade 8 | $\mathbf{1 6 4}$ | $\mathbf{1 5 0}$ | $\mathbf{1 5 0}$ |
| Total |  |  |  |

Choosing as many schools as possible from the Grade 4 \& Grade 8 stratum resulted in a sample of 150 schools $(136+14)$ for each grade level, from a total of 164 sampled schools. In this case, both studies were administered in the 136 schools selected from the Grade 4 \& Grade 8 stratum.

This sampling technique was most often used for TIMSS countries and benchmarking participants that had schools with students in both fourth and eighth grade populations, where there was a strong correlation between the measure of size at both grades across these schools, and when school samples could be drawn at the same time.

## Sampling Method B: Sampling Modifications for Sequential Data Collection

Method B was used to minimize overlap with another study such as a national study that also samples schools, and was also used when Method A was not appropriate (e.g., low correlation between MoS for fourth grade and eighth grade, samples not drawn simultaneously). In Method B, schools were sampled using a technique described in Chowdhury, Chu, and Kaufman (2000). As explained by the authors, the method can be used to either minimize or maximize overlap amongst several samples. This method is illustrated below with an example where the aim was to minimize the overlap between a current sample of schools $\mathrm{S}_{2}$ and a previously selected school sample $\mathrm{S}_{1}$. (For a complete description of the method, readers are referred to the original paper).

Let RL (Response Load) be the number of times a school was sampled from previous samples. In this example, given that there is only one previous sample, RL takes the value ' 1 ' if the school was already selected and ' 0 ' otherwise.

Given that the RL variable splits the current school frame in two distinct subsets of schools, $S_{1}$ and $\bar{S}_{1}$, we have the following relation:

$$
\begin{equation*}
P_{i}\left(S_{2}\right)=P_{i}\left(S_{2} \mid S_{1}\right) \cdot P_{i}\left(S_{1}\right)+P_{i}\left(S_{2} \mid \bar{S}_{1}\right) \cdot P_{i}\left(\bar{S}_{1}\right) \tag{1}
\end{equation*}
$$

where $P_{i}\left(S_{j}\right)$ gives the probability that school $i$ be selected in the sample $\left(S_{j}\right)$, and $P_{i}\left(S_{j} \mid S_{k}\right)$ gives the probability that school $i$ be selected in sample $\left(S_{j}\right)$ given that school $i$ already belongs to $\left(S_{k}\right)$. The idea here is to derive the conditional probabilities in such a way that the unconditional probability of selecting a school in the current sample, $P_{i}\left(S_{2}\right)$, be equal to the expected probability (as defined by the TIMSS sample design).

Note that the first term after the equal sign in equation (1) is related to cases where the school response load is one, while the last term is related to cases where the school response load is zero. Therefore, minimizing the sample overlap is equivalent to zeroing the first term. In such case, equation (1) becomes:

$$
P_{i}\left(S_{2}\right)=0 \cdot P_{i}\left(S_{1}\right)+P_{i}\left(S_{2} \mid \bar{S}_{1}\right) \cdot P_{i}\left(\bar{S}_{1}\right)
$$

and consequently,

$$
P_{i}\left(S_{2} \mid \bar{S}_{1}\right)=P_{i}\left(S_{2}\right) / P_{i}\left(\bar{S}_{1}\right)
$$

In other words, in the current sample $S_{2}$, schools would be selected with the following conditional probabilities:

0 if school $i$ was already selected in the first sample,

$$
P_{i}\left(S_{2}\right) / P_{i}\left(\bar{S}_{1}\right) \text { otherwise }
$$

However, equation (1) no longer holds if expression $P_{i}\left(S_{2}\right) / P_{i}\left(\bar{S}_{1}\right)$ is greater than one. This can be avoided by setting one as an uper bound. We now have the following expression:

$$
P_{i}\left(S_{2}\right)=P_{i}\left(S_{2} \mid S_{1}\right) \cdot P_{i}\left(S_{1}\right)+1 \cdot P_{i}\left(\bar{S}_{1}\right)
$$

and consequently

$$
\frac{P_{i}\left(S_{2}\right)-P_{i}\left(\bar{S}_{1}\right)}{P_{i}\left(S_{1}\right)}=P_{i}\left(S_{2} \mid S_{1}\right)
$$

Combining these two results, the conditional probabilities to use when selecting the current sample of schools are given by:

$$
\begin{aligned}
& \operatorname{Max}\left[0, \frac{P_{i}\left(S_{2}\right)-P_{i}\left(\bar{S}_{1}\right)}{P_{i}\left(S_{1}\right)}\right] \text { if school } i \text { was already selected in the first sample } \\
& \operatorname{Min}\left[\frac{P_{i}\left(S_{2}\right)}{P_{i}\left(\bar{S}_{1}\right)}, 1\right] \quad \text { otherwise }
\end{aligned}
$$

Note that maximizing rather than minimizing the overlap between two studies can be done by simply zeroing the last term of equation (1) rather than zeroing the first term, and following the above logic to get the conditional probabilities. The Chowdhury, Chu, and Kaufman (2000) method can be generalized to more than two samples as described in their paper.

Further details about the implementation of this method for the countries and benchmark participants can be found in the Sample Implementation in TIMSS 2015 chapter.

## CHAPTER 4

## Estimating Standard Errors in the TIMSS 2015 Results

Pierre Foy Sylvie LaRoche

To obtain estimates of students' proficiency in mathematics and science that are both accurate and cost-effective, TIMSS 2015 made extensive use of probability sampling techniques to sample students from national fourth and eighth grade student populations, and applied matrix-sampling assessment designs to target individual students with a subset of the complete pool of assessment items. This approach made efficient use of resources, in particular keeping student response burden to a minimum, but at a cost of some variance or uncertainty in the reported statistics, such as the means and percentages computed to estimate population parameters.

To quantify this uncertainty, each statistic in the TIMSS 2015 international reports is accompanied by an estimate of its standard error. For statistics reporting student achievement, which are based on plausible values, standard errors have two components. The first reflects the uncertainty due to generalizing from student samples to the entire fourth or eighth grade student populations, referred to as sampling variance, and the second reflects uncertainty due to inferring students' performance on the entire assessment from their performance on the subset of items that they took, known as imputation variance. For parameter estimates of variables that are not plausible values, standard errors are based entirely on sampling variance.

## Estimating Sampling Variance

TIMSS makes extensive use of probability sampling to derive achievement results from national samples of students. Because many such samples are possible but only one sample is drawn, some uncertainty about how well the sample represents the population is to be expected. The uncertainty caused by sampling students from a target population, known as sampling variance, can be estimated from the data of the one sample drawn.

Whereas estimating the sampling variance from simple random samples is a relatively easy task, estimating the sampling variance from the complex sample design of TIMSS is a more challenging endeavor.

A common way to estimate the sampling variance in multistage cluster sampling designs is through resampling schemes such as the balanced repeated replication and Jackknife techniques (Johnson \& Rust, 1992; Wolter, 1985). TIMSS uses one variation of the Jackknife, the Jackknife Repeated Replication (JRR), to estimate sampling variances. JRR was chosen because it is computationally straightforward and provides approximately unbiased estimates of the sampling variances and sampling errors of means, total, and percentages.

At the core of the JRR technique is the grouping of sampling units into zones based on sample design conditions (e.g., strata) and subsequent repeated draws of subsamples from these zones, i.e., repeated replication. For TIMSS, the two main features of the TIMSS sample design that JRR incorporates in its repeated draws of subsamples are the stratification of schools and the clustering of students within schools. This is done by defining Jackknife sampling zones according to the stratification scheme in each zone and by pairing successive schools ${ }^{1}$ to model the clustering from each national sample (see Chapter 3 for information on the Sample Design). Since most national samples consist of 150 schools, a total of 75 zones are created. If more than 150 schools are selected, then the additional zones are collapsed into the first 75 zones. The subsampling required by JRR is applied within each sampling zone.

Sampling zones are constructed within explicit strata. When an explicit stratum has an odd number of schools, either by design or because of school non-response, the students in the remaining school are randomly divided to make up two "quasi" schools for the purposes of calculating jackknife standard errors. ${ }^{2}$ Each sampling zone then consists of a pair of schools or "quasi" schools.

Exhibit 4.1 lists the number of sampling zones for each TIMSS 2015 participating country.

Benchmarking Participants

| Buenos Aires, Argentina | 70 | 66 |
| :--- | :--- | :--- |
| Ontario, Canada | 75 | 71 |
| Quebec, Canada | 61 | 63 |
| Norway (4 and 8) | 70 | 72 |
| Abu Dhabi, UAE | 72 | 75 |
| Dubai, UAE | 75 | 75 |
| Florida, US | 27 | 27 |

The JRR procedure draws two subsamples from each sampling zone: one where the first school in the pair is included and the second school is removed, and another subsample where the second school is included and the first school is removed. ${ }^{3}$ When a school is removed from the sample, the weights of the remaining school are doubled to make up for the omitted school. In both subsamples,

[^2]all students in the other sampling zones are included. With this process applied in each of the 75 sampling zones, the JRR procedure yields a total of 150 replicate subsamples, each one with its own set of replicate sampling weights to account for the successive removal of each school from the pair of schools in any given sampling zone.

The process of creating replicate sampling weights for the replicate subsamples defines replicate factors $k_{h j}$ as follows:

$$
k_{h j}=\left\{\begin{array}{l}
2 \text { for students in school } j \text { of sampling zone } h  \tag{1}\\
0 \text { for students in the other school of sampling zone } h \\
1 \text { for students in any other sampling zone }
\end{array}\right.
$$

These replicate factors are used to compute the 150 sets of replicate sampling weights as follows:

$$
\begin{equation*}
W_{h j i}=k_{h j} \cdot W_{0 i} \tag{2}
\end{equation*}
$$

where $W_{0 i}$ is the overall sampling weight of student $i$ and $W_{h j i}$ is the resulting replicate sampling weight of student $i$ from sampling zone $h$ when school $j$ is included and the other school in the pair is removed.

Exhibit 4.2 illustrates how the replicate factors, necessary to produce the replicate sampling weights, are derived. Within each sampling zone, each school is assigned randomly an indicator $u_{h j}$, coded either 0 or 1 , such that one school has a value of 0 and the other a value of 1 . This indicator serves to identify which schools within each zone will be successively included or removed. When a school is removed from a zone, the replicate factor is set to zero and the sampling weights of all students in that school are set to zero; when a school is included, the replicate factor is set to two and the sampling weights of all students in that school are doubled. The sampling weights of students in all other sampling zones remain unchanged.

For example, sampling zone 1 yields two sets of replicate sampling weights. The first set has doubled sampling weights $\left(k_{11}=2\right)$ for the students in the first school $\left(u_{11}=0\right)$ of zone 1 , zeroed sampling weights $\left(k_{12}=0\right)$ for the students in the second school $\left(u_{12}=1\right)$ of zone 1 , and unchanged sampling weights ( $k_{h j}=1$ ) for all students in the other sampling zones. The second set of replicate sampling weights has zeroed sampling weights $\left(k_{11}=0\right)$ for the students in the first school ( $u_{11}=$ 0 ) of zone 1 , doubled sampling weights $\left(k_{12}=2\right)$ for the students in the second school ( $u_{12}=1$ ) of zone 1 , and unchanged sampling weights $\left(k_{h j}=1\right)$ for all students in the other sampling zones.

Exhibit 4.2: Construction of Replicate Factors Across Sampling Zones

| Sample Zone | School Replicate Indicator ( $\mathrm{u}_{\mathrm{hj}}$ ) | Replicate Factors for Computing JRR Replicate Sampling Weights ( $\mathrm{k}_{\mathrm{hj}}$ ) |  |  |  |  |  |  |  |  |  |  |  |

|  |  | (1) | (2) | (3) | (4) | (5) | (6) |  | (2h_1) | (2h) |  | (149) | (150) |
| 1 | 0 | 2 | 0 | 1 | 1 | 1 | 1 | ... | 1 | 1 | ... | 1 | 1 |
|  | 1 | 0 | 2 |  |  |  |  |  |  |  |  |  |  |
| 2 | 0 | 1 | 1 | 2 | 0 | 1 | 1 | ... | 1 | 1 | ... | 1 | 1 |
|  | 1 |  |  | 0 | 2 |  |  |  |  |  |  |  |  |
| 3 | 0 | 1 | 1 | 1 | 1 | 2 | 0 | ... | 1 | 1 | ... | 1 | 1 |
|  | 1 |  |  |  |  | 0 | 2 |  |  |  |  |  |  |
| ! | $\vdots$ | $\vdots$ | ! | : | $\vdots$ | $\vdots$ | $\vdots$ | $\because$ | : | ! | $\vdots$ | ! | ! |
| h | 0 | 1 | 1 | 1 | 1 | 1 | 1 | ... | 2 | 0 | $\ldots$ | 1 | 1 |
|  | 1 |  |  |  |  |  |  |  | 0 | 2 |  |  |  |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | : | $\vdots$ | ! | : | $\vdots$ | ! | $\vdots$ | $\because$ | $\vdots$ | $\vdots$ |
| 75 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | ... | 1 | 1 | $\cdots$ | 2 | 0 |
|  | 1 |  |  |  |  |  |  |  |  |  |  | 0 | 2 |

The process is repeated across all 75 possible sampling zones, generating 150 sets of replicate sampling weights. The replicate sampling weights are then used to estimate a statistic of interest 150 times. The variation across these 150 jackknife estimates determines the sampling variance.

Given a statistic $t$ to be computed from a national sample, the formula used to estimate the sampling variance of that statistic, based on the TIMSS JRR algorithm, is given by the following equation:

$$
\begin{equation*}
\operatorname{Var}_{j r r}\left(t_{0}\right)=\frac{1}{2} \sum_{h=1}^{75} \sum_{j=1}^{2}\left(t_{h j}-t_{0}\right)^{2} \tag{3}
\end{equation*}
$$

where the term $t_{0}$ denotes the statistic of interest estimated with the overall student sampling weights $W_{0 i}$ and the term $t_{h j}$ denotes the same statistic computed using the set of replicate sampling weights $W_{h j i}$ obtained from sampling zone $h(h=1, \ldots, 75)$, where the $j^{\text {th }}$ school $\left(1^{\text {st }}\right.$ or $\left.2^{\text {nd }}\right)$ in the zone is included and the other removed.

The sampling variance estimated with the TIMSS JRR method properly measures the variation arising from having sampled students using the multi-stage stratified cluster sample design. Its square root is the standard error for any statistic derived from variables other than plausible values. Examples of such statistics include the mean age of students, the mean scale score on the TIMSS Students Like Learning Mathematics contextual scale, and the percentage of students with at least one parent with a university degree.

## Estimating Imputation Variance

For variables other than plausible values, standard errors were the result solely of sampling variation, and were computed using the JRR technique. However, the situation for plausible values was more complicated. As described in Chapter 4 of the TIMSS 2015 Assessment Frameworks, the TIMSS item pool was far too extensive to be administered in its entirety to any one student, and so a matrix-sampling assessment design was adopted whereby each student was given a single test booklet containing only a part of the entire assessment. The results for all of the booklets were then aggregated using item response theory to provide results for the entire assessment. Multiple imputation was used to derive reliable estimates of student performance (plausible values) on the assessment as a whole, even though each student responded to just a subset of the assessment items. Because every student proficiency estimate incorporates a random element, TIMSS 2015 followed the customary procedure of generating five estimates for each student and using the variability among them as a measure of the imputation uncertainty, or error.

The general procedure for estimating the imputation variance when analyzing student achievement data follows the basic principle of performing any statistical analysis five times-once for each set of plausible values-and aggregating the five sets of results (Mislevy et al., 1992). Thus, for any given achievement-based statistic $t$, estimating that statistic from each plausible value yields five estimates $t_{m}, m=1, \ldots, 5$, all of them computed using the overall student sampling weights $W_{0 i}$. The final estimate of that statistic, $t_{0}$, is the average of these five estimates:

$$
\begin{equation*}
t_{0}=\frac{1}{5} \sum_{m=1}^{5} t_{m} \tag{4}
\end{equation*}
$$

The imputation variance of the statistic $t_{0}$ is simply the variance of the five results from the plausible values, computed as follows:

$$
\begin{equation*}
\operatorname{Var}_{i m p}\left(t_{0}\right)=\frac{6}{5} \sum_{m=1}^{5} \frac{\left(t_{m}-t_{0}\right)^{2}}{4} \tag{5}
\end{equation*}
$$

where the factor $\frac{6}{5}$ is a correction factor required by the multiple imputation methodology. This imputation variance is then added to the sampling variance to produce the total variance estimate of the statistic $t_{0}$, as follows:

$$
\begin{equation*}
\operatorname{Var}_{t o t}\left(t_{0}\right)=\operatorname{Var}_{j r r}\left(t_{0}\right)+\operatorname{Var}_{i m p}\left(t_{0}\right) \tag{6}
\end{equation*}
$$

The sampling variance in this context is the average of the sampling variances from the five plausible values, as follows:

$$
\begin{equation*}
\operatorname{Var}_{j r r}\left(t_{0}\right)=\frac{1}{5} \sum_{m=1}^{5} \operatorname{Var}_{j r r}\left(t_{m}\right) \tag{7}
\end{equation*}
$$

where

$$
\begin{equation*}
\operatorname{Var}_{j r r}\left(t_{m}\right)=\frac{1}{2} \sum_{h=1}^{75} \sum_{j=1}^{2}\left(t_{m h j}-t_{m}\right)^{2} \tag{8}
\end{equation*}
$$

and $t_{m h j}$ is the appropriate JRR estimate based on plausible value computed using the set of replicate sampling weights from sampling zone $h$ where school $j$ is included. The square root of the total variance is then the proper standard error for any statistic based on plausible values, such as the average TIMSS mathematics achievement for girls and the percentage of students who reach the TIMSS advanced international benchmark of mathematics achievement.

Appendices 4A-D provide details on the jackknife sampling variance, the imputation variance, the total variance, and the overall standard error for each country's mean proficiency estimates in mathematics at the fourth grade, science at the fourth grade, mathematics at the eighth grade, and science at the eighth grade, respectively.

## Estimating Standard Errors for International Averages

Some exhibits in the TIMSS 2015 reports include international averages and their standard errors. For example, Exhibit 1.10 reports the international average for the percentages of girls and boys and their fourth grade mathematics and science achievement. International averages are computed using the data from the participating countries included in the main table of an exhibit. Data from the benchmarking participants is not included in the estimation of international averages.

For any given statistic $t_{0}$, its international average is given by:

$$
\begin{equation*}
t_{i n t}=\frac{1}{N} \sum_{i=1}^{N} t_{0 i} \tag{9}
\end{equation*}
$$

where $N$ is the number of countries contributing to the international average and $t_{0 i}$ is the estimate of our statistic of interest for the $i^{\text {th }}$ country.

The variance of the international average $t_{\text {int }}$ is given by:

$$
\begin{equation*}
\operatorname{Var}\left(t_{i n t}\right)=\frac{1}{N^{2}} \sum_{i=1}^{N} \operatorname{Var}_{\text {tot }}\left(t_{0 i}\right) \tag{10}
\end{equation*}
$$

where $\operatorname{Var}_{\text {tot }}\left(t_{0 i}\right)$ is the total variance of our statistic of interest for the $i^{t h}$ country, as given in equation (6) above. For statistics based on plausible values, the total variance includes the sampling variance and the imputation variance. For statistics not based on plausible values, such as percentages, the total variance is based entirely on the sampling variance, as shown in equation (3) above. The standard error of the international average is the square root of the total variance.

## CHAPTER 5

## Sample Implementation in TIMSS 2015

Sylvie LaRoche
Pierre Foy

## Overview

Rigorous sampling of schools and students was a key component of the TIMSS 2015 project. Implementing the sampling plan was the responsibility of the National Research Coordinator (NRC) in each participating country. NRCs were supported in this endeavor by the TIMSS 2015 sampling consultants, Statistics Canada, and the Sampling Unit of the IEA Data Processing and Research Center (DPC). Sampling consultants conducted the school sampling for most countries and trained NRCs using the Windows ${ }^{\circledR}$ Within-school Sampling Software (WinW3S) provided by the IEA DPC to implement within-school sampling. As an essential part of their sampling activities, NRCs were responsible for providing detailed documentation describing their national sampling plans (sampling data, school sampling frames, and school sample selections). The documentation for each TIMSS participant was reviewed and completed by the sampling consultants, including detailed information on coverage and exclusion levels, stratification variables, sampling, participation rates, and variance estimates. The TIMSS \& PIRLS International Study Center and the TIMSS 2015 Sampling Referee, Dr. Keith Rust of Westat, Inc., used this information to evaluate the quality of the samples.

This chapter gives a summary of the major characteristics of the national samples for TIMSS 2015. More detailed summaries of the sample design for each country, including details of population coverage and exclusions, stratification variables, and schools' sampling allocations, are provided in Appendix 5A Characteristics of National Samples.

## Target Population

As described in Chapter 3 (Sample Design), the international target populations for the TIMSS 2015 fourth and eighth grade assessments were defined as the grades that represented 4 and 8 years of formal schooling, respectively, counting from the first year of primary or elementary schooling.

As a new initiative for the TIMSS 2015 cycle, countries could participate in TIMSS Numeracya new, less difficult mathematics assessment at the fourth grade. TIMSS Numeracy was designed for countries where students found the TIMSS fourth grade mathematics assessment too difficult. Countries considering TIMSS Numeracy had the option of participating in both TIMSS Numeracy and the TIMSS fourth grade assessment or in TIMSS Numeracy only. For countries who participated in both assessments, the student sample size was doubled and the TIMSS and TIMSS Numeracy booklets were rotated within the sampled classes. Thus, students within sampled classes in these countries were given either a TIMSS booklet or a Numeracy booklet.

Bahrain, Indonesia, the Islamic Republic of Iran, Kuwait, and Morocco, along with the benchmarking participant Buenos Aires, administered both TIMSS and TIMSS Numeracy to their fourth grade students. Jordan administered TIMSS Numeracy only at the fourth grade while South Africa administered the TIMSS Numeracy test at the fifth grade.

Exhibits 5.1 and 5.2 present the grades identified as the target grades for sampling by each country, and include the number of years of formal schooling that the grades represent and the average age of students in the target grades at the time of testing.

For most countries, the target grades did indeed turn out to be the grades with 4 and 8 years of schooling, i.e., fourth and eighth grades, respectively. However, in England, Northern Ireland, and New Zealand, children begin primary school at an early age. ${ }^{1}$ Therefore, these countries administered the TIMSS fourth grade assessment in the fifth year of schooling. The TIMSS eighth grade assessment for England and New Zealand was administered in the ninth year of schooling. Norway chose to assess its fifth and ninth grades to obtain better comparisons with Sweden and Finland.

To provide a better match with the demands of the assessments, Botswana and South Africa availed themselves of the option to assess students at a higher grade. South Africa administered the TIMSS Numeracy fourth grade assessment at the fifth grade, and Botswana and South Africa administered the eighth grade assessment at the ninth grade. testing would be less than 9.5 years and, for eighth grade students, less than 13.5 years.

## National Coverage and Exclusions

Exhibits 5.3 and 5.4 summarize population coverage and exclusions for the TIMSS 2015 target populations.

## Coverage

National coverage of the international target population was generally comprehensive, with some exceptions. At the fourth grade, these exceptions included Canada (assessed students only from the provinces of Alberta, Manitoba, Newfoundland, Ontario and Quebec) and Georgia (assessed only students taught in Georgian), together with the benchmarking state of Florida from the United States (assessed students only in public schools). These participants chose a national target population that was less than the international target population. At the eighth grade, all countries except Canada (assessed students only from the provinces of Manitoba, Newfoundland, Ontario and Quebec) and Georgia (assessed only students taught in Georgian), as well as the benchmarking state of Florida (only students from public schools) sampled from 100 percent of their international desired population. For the exceptions where coverage was below 100 percent, the results were footnoted in the TIMSS 2015 international reports.

## School-Level and Student-Level Exclusions

Within the national target population, it was possible to exclude certain types of schools and students. For the most part, school-level exclusions consisted of schools for students with disabilities and very small or remote schools. Occasionally, schools were excluded for other reasons, as documented in Appendix 5A Characteristics of National Samples.

Student-level, or within-school, exclusions generally consisted of students with disabilities or students who could not be assessed in the language of the test. For most participants, the overall percentage of excluded students (combining school and within-school levels) was 5 percent or less after rounding. However, at the fourth grade, Bahrain, Canada, Denmark, Italy, Lithuania, Portugal, Singapore, Spain, Sweden, United States, and Abu Dhabi had exclusions accounting for between 5 and 10 percent of the desired population, and only Serbia had exclusions exceeding 10 percent. At the eighth grade, Georgia, Italy, Lithuania, and Singapore had exclusions accounting for between 5 and 10 percent of the national target population. Only Israel had exclusions exceeding 10 percent.

Results for participants with an exclusion rate of more than 5 percent were annotated in the international reports. Note that some TIMSS 2015 participants had no within-school exclusions.

## Target Population Size

Exhibits 5.5 and 5.6 show the number of schools and students in each participant's target population ${ }^{2}$ and sample, as well as an estimate of the student population size based on the sample data. The target population figures are derived from the sampling frame used to select the TIMSS 2015 samples, while the sample figures are based on the number of sampled schools and students that participated in the assessments. The sample figures were computed using sampling weights, which are explained in more detail in Chapter 3. The student population size based on the sampling frame did not take into account the portion of the population excluded within sampled schools and made no adjustment for changes in the population between the date when the information in the sampling frame was collected and the date of the TIMSS 2015 data collection-usually a 2-year interval. Nevertheless, a comparison of the two estimates of population size can be seen as a validity check on the sampling procedure. In most cases, the population size estimated from the sample closely matched the population size from the sampling frame.

## Meeting TIMSS 2015 Standards for Sampling Participation

TIMSS 2015 participants understood that the goal for sampling participation was 100 percent for all sampled schools, classrooms, and students. Guidelines for reporting achievement data for participants securing less than full participation were modeled after IEA's previous TIMSS assessment cycles. As summarized below in Exhibit 5.7, countries were assigned to one of three categories on the basis of their sampling participation. Countries in Category 1 were considered to have met all TIMSS 2015 sampling requirements and to have acceptable participation rates. Countries in Category 2 met the participation requirements only after including replacement schools. Countries that failed to meet the participation requirements even with the use of replacement schools were assigned to Category 3. One of the main goals for quality data in TIMSS 2015 was to have as many countries as possible achieve Category 1 status.

| Category 1 | Acceptable sampling participation rate without the use of replacement schools. |
| :---: | :---: |
|  | In order to be placed in this category, a country had to have: |
|  | - An unweighted school response rate without replacement of at least $85 \%$ (after rounding to nearest whole percent) AND an unweighted student response rate (after rounding) of at least 85\% |
|  | OR |
|  | - A weighted school response rate without replacement of at least $85 \%$ (after rounding to nearest whole percent) AND a weighted student response rate (after rounding) of at least $85 \%$ |
|  | OR |
|  | - The product of the (unrounded) weighted school response rate without replacement and the (unrounded) weighted student response rate of at least $75 \%$ (after rounding to the nearest whole percent). |
|  | Countries in this category would appear in the tables and figures in international reports without annotation, and will be ordered by achievement as appropriate. |
| Category 2 | Acceptable sampling participation rate only when replacement schools are included. A country would be placed in this category 2 if: |
|  | - It failed to meet the requirements for Category 1 but had a weighted school response rate without replacement of at least $50 \%$ (after rounding to the nearest percent) |
|  | AND HAD EITHER |
|  | - A weighted school response rate with replacement of at least $85 \%$ (after rounding to nearest whole percent) AND a weighted student response rate (after rounding) of at least 85\% |
|  | OR |
|  | - The product of the (unrounded) weighted school response rate with replacement and the (unrounded) weighted student response rate of at least $75 \%$ (after rounding to the nearest whole percent). |
|  | Countries in this category would be annotated with a " $\dagger$ " in the tables and figures in international reports, and ordered by achievement as appropriate. |
|  | Unacceptable sampling response rate even when replacement schools are included. Countries that could provide documentation to show that they complied with TIMSS sampling procedures and requirements but did not meet the requirements for Category 1 or Category 2 would be placed in Category 3. |
| Category 3 | Countries in this category would be annotated with a " $\ddagger$ " if they nearly met the requirements for Category 2. Countries would be annotated with a " $\ddagger$ " if they failed to meet the participation requirements but had a school participation rate of at least $50 \%$ before the use of replacement schools. At last, if none of these conditions are met, countries would appear in a separate section of the achievement tables, below the other countries, in international reports. These countries would be presented in alphabetical order. |

Exhibits 5.8 through 5.11 present the school, classroom, student, and overall weighted and unweighted participation rates for each of the participants in the TIMSS 2015 fourth and eighth grade assessments, respectively. Almost all participants had excellent participation rates and belonged in Category 1. At the fourth grade, Belgium (Flemish), Canada, Denmark, Hong Kong, The Netherlands, and the United States achieved the minimum acceptable participation rate only after including replacement schools, and therefore their results were annotated with a dagger ( $\dagger$ )
in the achievement exhibits of the international reports (Category 2). Despite efforts to secure full participation, Northern Ireland's overall participation at 71 percent fell below the minimum requirement of 75 percent, even after using replacement schools. Results for Northern Ireland in the international reports were annotated with a double-dagger ( $\ddagger$ ), indicating that they nearly satisfied the guidelines for sample participation.

At the eighth grade, Canada, New Zealand, the United States, and the benchmarking participant of Buenos Aires, Argentina, achieved the minimum acceptable participation rates only after including replacement schools, and therefore their results were annotated with a dagger $(\dagger)$ in the achievement exhibits of the international reports (Category 2).

Finally, the benchmarking participant of Quebec, Canada, did not meet the required sampling participation rate at the fourth and eighth grades, even with the use of replacement schools and were annotated with a triple-dagger ( $\ddagger$ ) in the achievement exhibits of the international reports (Category 3).

TIMSS guidelines for sampling participation: The minimum acceptable participation rates were 85 percent of both schools and students, or a combined rate (the product of school and student participation) of 75 percent. Participants not meeting these guidelines were annotated as follows:
$\dagger$ Met guidelines for sample participation rates only after replacement schools were included.
\# Nearly satisfied guidelines for sample participation rates after replacement schools were included.
末 Did not satisfy guidelines for sample participation rates.

TIMSS guidelines for sampling participation: The minimum acceptable participation rates were 85 percent of both schools and students, or a combined rate (the product of school and student participation) of 75 percent. Participants not meeting these guidelines were annotated as follows:
$\dagger$ Met guidelines for sample participation rates only after replacement schools were included.
₹ Nearly satisfied guidelines for sample participation rates after replacement schools were included.
$\ddagger$ Did not satisfy guidelines for sample participation rates.

Students attending a sampled class at the time the sample was chosen but leaving the class before the assessment was administered were classified as "withdrawn."
Students with a disability or language barrier that prevented them from participating in the assessment were classified as "excluded."
Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as "absent."

## TIMSS 2015 Trends in Student Populations

Because an important goal of the TIMSS 2015 assessment was to measure changes in students' mathematics and science achievement across assessment cycles, it was important to track any changes over time in population composition and coverage that might be related to student achievement. Exhibits 5.16 and 5.17 present, for each country, trends across cycles (2015, 2011, 2007, 2003, 1995 at the fourth grade and 2015, 2011, 2007, 2003, 1999, and 1995 at the eighth grade) in four important characteristics of the assessment populations: number of years of formal schooling, average student age, percent of students in the national target population excluded from the assessment, and overall participation rates after using replacements. Most countries and benchmarking participants were very similar with regard to these characteristics across the four assessment cycles at the fourth grade and five cycles at the eighth grade, although there have been changes in some countries in the age and grade structure of the assessed populations, in the target population coverage and in the exclusion rate.

The Russian Federation and Slovenia have undergone structural changes in the age at which children enter schools that are reflected in their samples. In 2003, the Russian fourth grade sample contained third grade students from some regions and fourth grade students from others, whereas all students were in the fourth grade by 2007. At the eighth grade, there was still a mixture of seventh and eighth grade students in 2007, but by 2011 the sample was all eighth grade students,
with correspondingly a higher average age. By 2007, Slovenia had completed the transition towards having all children begin school at an earlier age so that they all would have four years of primary schooling at the fourth grade instead of three years, as was the case in 2003.

National coverage of the international target population was generally comprehensive for most countries and has not changed across assessments, with some exceptions. At the fourth grade, Kuwait assessed only students in public schools in 2011 but also tested students from the private schools in 2015. Therefore the 2015 trend population for Kuwait included only students from the public schools, which represents 60 percent of the 2015 target population. At the fourth and eighth grades, Lithuania tested students in Lithuanian, Russian, and Polish in 2015, while Lithuanian was the only test language used for the assessment in 2011. As a result, the 2015 trend population for Lithuania included only students taught in Lithuanian, which represent 91 percent and 93 percent, at the fourth and eighth grades, respectively.

In general, the exclusion rates do not exceed the TIMSS 2015 guidelines of 5 percent, and have not changed very much across assessments for most countries. A few countries saw a decrease in their overall exclusion rate. At the fourth grade, Belgium (Flemish) reduced their overall exclusion rate of 3.6 percent between 2011 and 2015 by assessing eligible students from special needs schools. From 2011 to 2015, Hong Kong SAR decreased its overall exclusion rate, at the fourth and eighth grades, by over 6 and close to 4 percentage points, respectively, by assessing students from their international schools. Finally, Florida decreased their exclusion rate at the fourth and eighth grades by more than 7 and 4 percentage points, respectively, by providing more precise guidelines on within-school exclusions of special needs students. On the other hand, the student exclusion rate was higher in 2015 than in 2011 at the fourth grade in Bahrain, Italy, Kuwait, Portugal, Serbia, Singapore, Slovenia, Sweden, and the benchmarking participants of Quebec, Canada, and Abu Dhabi, United Arab Emirates. At the eighth grade, those with higher exclusions since 2011 included Bahrain, Georgia, Hungary, Italy, Lithuania, Malaysia, Slovenia, Norway (eighth grade), and the benchmarking participants of and Abu Dhabi and Dubai of the United Arab Emirates.

* Represents years of schooling counting from the first year of ISCED Level 1.

Georgian schools in South Ossetia and Abkhazia were excluded in 2011 due to lack of access and absence of official statistics. Abkhazia refugee schools in other territories of Georgia were included in the sample frame.
Bahrain in 2011, Korea in 2003, Lithuania in 1999, and Dubai (UAE) in 2007 tested the same cohort of students as other countries, but later in the assessment year. South Africa (9) tested one year later.
Trend results for Kuwait do not include private schools. Trend results for Lithuania do not include students taught in Polish or in Russian.
An empty cell indicates a country did not participate in that year's assessment. A dash (-) indicates comparable data not available.

* Represents years of schooling counting from the first year of ISCED Level 1.

Georgian schools in South Ossetia and Abkhazia were excluded in 2011 due to lack of access and absence of official statistics. Abkhazia refugee schools in other territories of Georgia were included in the sample frame.
Bahrain in 2011, Korea in 2003, Lithuania in 1999, and Dubai (UAE) in 2007 tested the same cohort of students as other countries, but later in the assessment year. South Africa (9) tested one year later.
Trend results for Kuwait do not include private schools. Trend results for Lithuania do not include students taught in Polish or in Russian.
An empty cell indicates a country did not participate in that year's assessment. A dash (-) indicates comparable data not available.

Exhibit 5.17: Trends in Student Populations - TIMSS 2015 - Eighth Grade (Continued)

| Country | Years of Formal Schooling* |  |  |  |  |  | Average Age at Time of Testing |  |  |  |  |  |

## Appendix 5A: Characteristics of National Samples

## Australia

Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<5$ ), nonmainstream schools, and very remote schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by state or territory (8)
- Implicit stratification by geographic location (metropolitan, provincial, remote), school type (catholic, government, independent), and socioeconomic index (low socioeconomic status, high socioeconomic status)
- Prior to class sampling within schools, all indigenous students were grouped into a single classroom and were selected with certainty. Other classroom was sampled using the standard procedure.
- No overlap between Grade 4 and Grade 8 school samples
- Schools were oversampled at the state/territory level

Allocation of School Sample in Australia, Fourth Grade

## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<5$ ), nonmainstream schools, and very remote schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by state or territory (8)
- Implicit stratification by geographic location (metropolitan, provincial, remote), school type (catholic, government, independent), and socioeconomic index (low socioeconomic status, high socioeconomic status)
- Within sampled schools, all indigenous students were regrouped into a single classroom that was sampled with certainty. When appropriate, classrooms were grouped according to the ability level of students prior to sampling and one classroom was sampled per class group.
- No overlap between Grade 4 and Grade 8 school samples
- Schools were oversampled at the state/territory level

Allocation of School Sample in Australia, Eighth Grade

|  |  |  | Participating Schools |  |  |  |  |

## Bahrain

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<$ 1), special needs schools, students taught in French, and students taught in Japanese
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by governorate (5), and gender (girls, boys) within public schools
- No implicit stratification
- Sampled two classrooms per school
- No overlap between Grade 4 and Grade 8 school samples
- All schools were selected
- Schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates

## Allocation of School Sample in Bahrain, Fourth Grade

| Explicit <br> Strata | Total <br> Sampled <br> Schools | Ineligible <br> Schools | Original <br> Schools | 1st <br> Public Muharraq - <br> Girls | 10 | 0 | 10 |

## Belgium (Flemish)

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size < 5)
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (6), socioeconomic status (2), school type (official, private), and a stratum of eligible special education schools
- No implicit stratification
- Sampled two classrooms in large schools (measure of size > 35)
- TIMSS 2015 Main Data Collection and PIRLS 2016 Field Test school samples were selected simultaneously to avoid overlap

## Allocation of School Sample in Belgium (Flemish), Fourth Grade

|  |  |  | Participating Schools |  |  |  |  |

## Botswana

## Ninth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- No school level exclusions
- Within-school exclusions consisted of students with intellectual disabilities, and students with functional disabilities

## Sample Design

- Explicit stratification by school type (public, private), region (6), and socioeconomic status (medium to high socioeconomic status, low socioeconomic status)
- No implicit stratification
- Sampled one classroom except in private schools where two classrooms were sampled
- Census for private schools
- In census stratum, schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates

## Allocation of School Sample in Botswana, Ninth Grade

|  |  |  | Participating Schools |  |  |  |  |

## Bulgaria

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<5$ ) and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (elementary, basic, general) and urbanization (capital, large cities, other)
- Implicit stratification by urbanization (city, village) within the basic schools found outside the larger cities
- Sampled two classrooms per school

## Allocation of School Sample in Bulgaria, Fourth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Total | 154 | 1 | 148 | 0 | 1 | 4 | 0 |

## Canada

Fourth Grade

## Coverage and Exclusions

- Coverage is 78.9 percent. Coverage in Canada is restricted to students from the provinces of Alberta, Manitoba, Newfoundland, Ontario, and Quebec.
- School-level exclusions consisted of very small schools (measure of size $<10$ in Quebec and measure of size $<6$ in Ontario, Alberta, Manitoba, and Newfoundland), special needs schools, international schools (in Quebec), federal schools (in Quebec), school boards with special status (in Quebec), band-operated schools (First Nation and Native schools), French schools (in Newfoundland), public special needs schools (in Manitoba), as well as private and home schools (in Manitoba)
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by provinces (5). Within the province of Alberta, explicit stratification was done by school system (French, English), and school type (immersion, regular). Within the province of Ontario, explicit stratification was done by 'Grade 4'/'Grade 4 and Grade 8', language (English, French) and school type (private, Catholic, public). Within Quebec, explicit stratification was done by school type (public, private) and language (French, English).
- Implicit stratification by region (4) in public and Catholic explicit strata within Ontario. Postal code (6) in English school system strata within Alberta.
- Sampled two classrooms in large schools for Quebec, two classroom per school for Ontario and Alberta, and one classroom per school for the rest of Canada
- Grade 4 and Grade 8 school samples were selected separately, with the exception of Ontario where Grade 4 and Grade 8 school samples were selected simultaneously with maximum overlap
- All Alberta French schools were selected
- In Alberta French schools classes were used as variance estimation strata and half classes were used as jackknife replicates

Allocation of School Sample in Canada, Fourth Grade

## Eighth Grade

## Coverage and Exclusions

- Coverage is 67.3 percent. Coverage in Canada is restricted to students from the provinces of Manitoba, Newfoundland, Ontario, and Quebec.
- School-level exclusions consisted of very small schools (measure of size $<10$ in Quebec and measure of size $<6$ in Ontario, Manitoba, and Newfoundland), special needs schools, international schools (in Quebec), federal schools (in Quebec), school boards with special status (in Quebec), band-operated schools (First Nation and Native schools), and French schools (in Newfoundland)
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by Provinces (4). Within the province of Ontario, explicit stratification was done by 'Grade 8'/'Grade 4 and Grade 8', language (English, French) and school type (private, Catholic, public). Within the province of Quebec, explicit stratification was done by school type (public, private) and language (French, English).
- Implicit stratification by region (4) in public and Catholic explicit strata within Ontario. Achievement within Quebec (Used in all strata with the exception of private -English stratum).
- Sampled two classrooms in large schools for Quebec and Ontario, one classroom per school for the rest of Canada
- Grade 4 and Grade 8 school samples were selected separately, with the exception of Ontario where Grade 4 and Grade 8 school samples were selected simultaneously with maximum overlap

## Allocation of School Sample in Canada, Eighth Grade

| Total | 160 | 2 | 157 | 1 | 0 | 0 | 0 |

## France

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<3$ ), overseas territories, Reunion and Mayotte Islands, Guyana (Southern Hemisphere), private schools without contract, specialized schools, and French schools in foreign countries
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (public-priority education zone, public-other, private)
- No implicit stratification
- Sampled two classrooms per school
- TIMSS 2015 samples and PIRLS 2016 samples were selected simultaneously to avoid overlap between the two studies

Allocation of School Sample in France, Fourth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Explicit Strata | Total Sampled Schools | Ineligible Schools | Original Schools | $\begin{array}{\|c\|} \hline \text { 1st } \\ \text { Replacements } \end{array}$ | 2nd Replacements | Refusal Schools | Excluded Schools |
| Public-priority education zone | 44 | 0 | 43 | 1 | 0 | 0 | 0 |
| Public-other | 100 | 1 | 97 | 2 | 0 | 0 | 0 |
| Private | 22 | 0 | 19 | 2 | 0 | 1 | 0 |
| Total | 166 | 1 | 159 | 5 | 0 | 1 | 0 |

## Georgia

## Fourth Grade

## Coverage and Exclusions

- Coverage is 90.4 percent. Coverage in Georgia is restricted to students taught in Georgian.
- School-level exclusions consisted of very small schools (measure of size < 5)
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by 'Grade 4'/'Grade 4 and Grade 8' schools, region (4), and Mathematics average score (low, medium, high)
- No implicit stratification
- Sampled two classrooms in large schools (measure of size $>90$ )
- Grade 4 and Grade 8 school samples were selected simultaneously with maximum overlap

Allocation of School Sample in Georgia, Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size < 5)
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school level socioeconomic status DEIS (urban band 1, urban band 2, rural), language of instruction (Gaelscoil, Gaeltacht, ordinary), and gender (boys, girls, mixed)
- Implicit stratification by location (cities, rural)
- Sampled two classrooms per school
- The school sample for TIMSS at Grade 4 was selected by controlling for the overlap with another National Study sample using the Chowdhury approach. No overlap between Grade 4 and Grade 8 samples.

## Allocation of School Sample in Ireland, Fourth Grade

| Explicit <br> Strata | Total <br> Sampled <br> Schools | Ineligible <br> Schools | Original <br> Schools | lst <br> Replacements | 2nd <br> Gaelscoil | 10 | 0 |

## Italy

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size < 5), Slovenian language schools, Ladin language schools, and German language schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (private, public), region (6) within public schools. A census of schools was taken in Bolzano.
- No implicit stratification
- Sampled two classrooms in large schools (measure of size > 110)
- The school sample for TIMSS at Grade 8 was selected by controlling for the overlap with the sample at Grade 4 using the Chowdhury approach
- In Bolzano schools or class were used as variance estimation strata and classes or half classes were used to build jackknife replicates. Two classrooms selected within these schools whenever possible.

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of special needs schools and minority language schools
- Within-school exclusions consisted of students with intellectual disabilities

## Sample Design

- Explicit stratification by school type (public, private), region (6), and gender (girls, boys) within public schools, and language (Arabic, foreign, bilingual) within private schools
- No implicit stratification
- Sampled two classrooms in large schools (measure of size $>80$ )
- Samples for TIMSS Main Data Collection and samples for PIRLS Field Test and Main Data Collection were drawn simultaneously to avoid overlap

Allocation of School Sample in Kuwait, Fourth Grade

## Norway (5 and 9)

## Fifth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), Sami language schools, international schools, and remote schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by 'Grade 5 ' / 'Grade 5 and Grade 9' schools, language (Bokmål, Nynorsk), and municipality size (small, medium, large)
- No implicit stratification
- Sampled two classrooms in large schools (measure of size > 35)
- Grade 5 and Grade 9 school samples were selected simultaneously with minimum overlap

Allocation of School Sample in Norway, Fifth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Explicit Strata | Total Sampled Schools | Ineligible Schools | Original Schools |  | $\begin{gathered} \text { 2nd } \\ \text { Replacements } \end{gathered}$ | Refusal Schools | Excluded Schools |
| Grade 5 - Bokmål Small Municipalities | 8 | 0 | 8 | 0 | 0 | 0 | 0 |
| Grade 5 - Bokmål - Medium <br> Municipalities | 28 | 0 | 26 | 0 | 0 | 2 | 0 |

## Ninth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<6$ ), Sami language schools, international schools, and remote schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by 'Grade 9' / 'Grade 5 and Grade 9' schools, language (Bokmål, Nynorsk) and municipality size (small, medium, large)
- No implicit stratification
- Sampled two classrooms in large schools (measure of size > 90)
- Grade 5 and Grade 9 school samples were selected simultaneously with minimum overlap

Allocation of School Sample in Norway, Ninth Grade

|  |  |  | Participating Schools |  |  |  |  |

| Total | 150 | 0 | 143 | 0 | 0 | 7 | 0 |

## Oman

Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ) and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by governorates (11) and school type (government, private, international)
- No implicit stratification
- Sampled two classrooms in census strata or in large schools from other strata
- The school sample for TIMSS at Grade 8 was selected by controlling for the overlap with the sample at Grade 4 using the Chowdhury approach
- Census in AL Buraimi, Musandam, and Al Wusta Governorate strata
- In census strata schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates. Two classrooms selected within these schools.

Allocation of School Sample in Oman, Fourth Grade

| Explicit <br> Strata | Total <br> Sampled <br> Schools | Ineligible <br> Schools | Original <br> Schools | 1st <br> Ad Dakhliyah <br> Governorate | 26 | 0 | 26 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ) and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by governorates (11), and special school type (government, private, international)
- Implicit stratification by gender (3)
- Sampled two classrooms in census strata or in large schools from other strata
- The school sample for TIMSS at Grade 8 was selected by controlling for the overlap with the sample at Grade 4 using the Chowdhury approach
- Census in AL Buraimi, Musandam, and Al Wusta Governorate strata
- In census strata schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates. Two classrooms selected within these schools.

## Portugal

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size < 6), special needs schools, and minority language schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (7) and school type (public, private)
- No implicit stratification
- Sampled two classrooms in large schools (measure of size > 140)
- No overlap between TIMSS 2015 and PIRLS 2016 main data collection samples except in the 6 smallest strata where all schools are sampled
- Probability proportional to (school) size systematic sampling was used in the 3 largest explicit strata, and systematic sampling selection with equal probabilities was used in all other strata

## Allocation of School Sample in Portugal, Fourth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Total | 222 | 1 | 193 | 19 | 5 | 4 | 0 |

## Qatar

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of instruction not in English or Arabic
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by 'Grade 4'/ 'Grade 4 and Grade 8'
- Implicit stratification by school type (private SEC, independent, community, private foreign) and gender (boys, girls, other)
- Sampled two classrooms in large schools (measure of size > 170)
- Grade 4 and Grade 8 school samples were selected simultaneously with maximum overlap
- Census of schools. Schools having Grade 4 and Grade 8 participated in TIMSS Main Data Collection for both grades.
- Schools or classrooms or half classrooms were used to build jackknife replicates for variance estimation

## Allocation of School Sample in Qatar, Fourth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Russian Federation

Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ) and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (42)
- No implicit stratification
- Sampled one classroom per school
- No overlap between Grade 4 and Grade 8 school samples
- An extra sampling stage (regions) was required prior to sampling schools. 28 of 69 regions were selected with probability proportional to the region size and 14 bigger regions were selected with certainty. While each certainty region itself is an explicit stratum, the other sampled regions make one large explicit stratum. In the large explicit stratum, a sample of schools is selected within each region.
- Within regions, schools were selected with probability proportional to (school) size systematic sampling. Schools were sorted (serpentine) by location (up to 7 levels) before being sorted by school size.
- Within the certainty regions, schools were paired for variance calculation purposes. Otherwise, selected regions were paired for variance calculation purposes.

## Saudi Arabia

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<6$ ) and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities and nonnative language speakers

## Sample Design

- Explicit stratification by gender (boys, girls), education type (religious, non-religious) and school type (government, non-government) within non-religious schools
- No implicit stratification
- Sampled one classroom per school
- No overlap between Grade 4 and Grade 8 school samples

## Allocation of School Sample in Saudi Arabia, Fourth Grade

| Explicit <br> Strata | Total <br> Sampled <br> Schools | Ineligible <br> Schools | Original <br> Schools | 1st <br> Replacements | 2nd <br> Revernment - <br> General - Boys | 78 | 2 |

## Singapore

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of special needs schools and private schools
- No within-school exclusions
- For TIMSS 2015, like in all previous cycles, Singapore took a census of all public schools with Grade 4 or Grade 8 students. The sampling frame excluded private schools, which are largely foreign-system schools operating in Singapore and which serve predominantly international students. These foreign-system schools are fundamentally different from the public schools in many respects (e.g., language of instruction; schoolcalendar year).

## Sample Design

- No explicit stratification
- No implicit stratification
- Sampled two classrooms per school
- No overlap between Grade 4 and Grade 8 school samples
- Census of all schools. Within schools, two half classrooms were sampled with probability proportional to the size of the classroom. Within selected classrooms, 19 students were randomly sampled.
- Schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates

## Allocation of School Sample in Singapore, Fourth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Spain

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), special needs schools, and international schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (7) and school type (public, private)
- No implicit stratification
- Sampled one classroom per school except for the private schools in La Rioja where two classrooms were sampled whenever possible
- Oversampled in Asturias, La Rioja, Castile and Leon, Catalonia, Andalusia and Madrid in order to get better estimates. In La Rioja-private stratum all schools were taken.
- In La Rioja- private stratum, schools or classrooms were used as variance estimation strata and classrooms or half classrooms were used to build jackknife replicates. Two classrooms selected within these schools whenever possible.

## Allocation of School Sample in Spain, Fourth Grade

## Eighth Grade

## Coverage and Exclusions

## - Coverage is 100 percent

- School-level exclusions consisted of special needs schools, geographically inaccessible schools, very small schools, and schools with different structure/curriculum
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by urbanization (urban, rural) and statistical regions (12) within urban
- No implicit stratification
- Sampled one classroom per school
- No overlap between Grade 4 and Grade 8 samples

## United Arab Emirates

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size <15) in Abu Dhabi and other Emirates, (measure of size $<10$ ) in Dubai, instruction language other than English or Arabic, and geographically inaccessible schools in Emirates other than Dubai and Abu Dhabi
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by 'Grade 4' / 'Grade 4 and Grade 8' schools, Emirates (7), national assessment score (4) and curriculum (Ministry of Education, UK/US/CAD, other). School type (public, private) within Dubai. Region (Abu Dhabi, Al Ain, Western region), school type (public, private), and performance level (low, medium, high) within Abu Dhabi.
- Implicit stratification by educational zones (Ajman, Fujairah, Ras Al Khaimah, Sharjah, Umm Al Quwain) and language of test (Arabic, English, French)
- Sampled two classrooms in schools from the western region, from 'Grade 4' schools in Abu Dhabi, from Dubai and from regions other than Sharjah
- Grade 4 and Grade 8 school samples were selected simultaneously with maximum overlap
- All schools were sampled in all regions except Sharjah, in Western region of Abu Dhabi and in Dubai
- The United Arab Emirates was divided into three large districts: Abu Dhabi (Abu Dhabi, Al Ain, and West region), Dubai, and the rest of the Emirates. All three districts were oversampled.
- In census strata, classes or half classes were used to build jackknife replicates for variance estimation. Two classrooms selected within these schools.

| Explicit Strata | Total Sampled Schools | Ineligible Schools | Original Schools | $\begin{array}{\|c\|} \hline \text { 1st } \\ \text { Replacements } \end{array}$ | $\qquad$ | Refusal Schools | Excluded Schools |
| Private - English | 8 | 0 | 8 | 0 | 0 | 0 | 0 |
| Private - French | 8 | 0 | 8 | 0 | 0 | 0 | 0 |
| Public - English | 40 | 0 | 38 | 1 | 0 | 1 | 2 |
| Public - French | 118 | 0 | 47 | 16 | 3 | 52 | 0 |
| Total | 174 | 0 | 101 | 17 | 3 | 53 | 2 |

## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<10$ ), special needs schools, international schools, federal schools, and school boards with special status
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (private, public) and language (English, French)
- Implicit stratification by Mathematics average score (3)
- Sampled two classrooms in large schools (measure of size >450)
- Grade 4 and Grade 8 school samples were selected separately

Allocation of School Sample in Quebec, Canada, Eighth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Private - English | 12 | 0 | 11 | 0 | 0 | 1 | 0 |
| Private - French | 26 | 1 | 25 | 0 | 0 | 0 | 0 |
| Public - English | 38 | 0 | 36 | 1 | 0 | 1 | 0 |
| Public - French | 100 | 1 | 30 | 19 | 0 | 50 | 0 |
| Total | 176 | 2 | 102 | 20 | 0 | 52 | 0 |

## Norway (4 and 8)

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size < 4), language other than Bokmal and Nynorsk, international schools, and remote schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by 'Grade 5' / 'Grade 5 and Grade 9' / 'Grade 4 only' schools, language (Bokmål, Nynorsk), and municipality size (small, medium, large)
- No implicit stratification
- Grade 4 school sample corresponds to the Grade 5 school sample, with an additional sample selected from the Grade 4 only schools stratum
- Grade 4 and Grade 8 school samples were selected simultaneously with minimum overlap

## Allocation of School Sample in Norway (4 and 8), Fourth Grade

|  |  |  | Participating Schools |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Explicit <br> Strata | Total <br> Sampled <br> Schools | Ineligible <br> Schools | Original <br> Schools | 1st <br> Replacements | 2nd <br> Replacements | Refusal <br> Schools | Excluded <br> Schools |

Grade 5 -

| Bokmål-Small | 8 | 0 | 8 | 0 | 0 | 0 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Municipalities

| Grade 5 - Bokmål - Medium Municipalities | 28 | 0 | 26 | 0 | 0 | 2 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## CHAPTER 6

## Survey Operations Procedures in TIMSS 2015

leva Johansone

## Overview

As data-based indicators of countries' student achievement profiles and learning contexts, TIMSS assessments are crucially dependent on the quality of the data collected by each participant. Whereas the development of the assessments is an intensely collaborative process involving all of the partners in the enterprise, the process of administering the assessments and collecting the data is uniquely the responsibility of each individual country or benchmarking participant.

To ensure the consistency and uniformity of approach necessary for high-quality, internationally comparable data, all participants are expected to follow a set of standardized operations procedures. These procedures have been developed over successive cycles of TIMSS through a partnership involving the TIMSS \& PIRLS International Study Center, the IEA Data Processing and Research Center (IEA DPC), the IEA Secretariat, Statistics Canada, and National Research Coordinators (NRCs). With each new assessment cycle, the operations procedures are updated to enhance efficiency and accuracy and reduce burden, making use of developments in information technology to automate routine activities wherever possible.

In each country or benchmarking entity, the National Research Coordinator was responsible for the implementation of TIMSS 2015. Internationally, National Research Coordinators provided the country's perspective in all international discussions, represented the country at international meetings, and were the responsible contact persons for all project activities. Locally, National Research Coordinators were responsible for implementing all the internationally agreed-upon procedures and facilitating all of the national decisions regarding TIMSS, including any adaptations for the national context.

The daily tasks of the NRCs varied over the course of the TIMSS 2015 cycle. In the initial phases, National Research Coordinators participated in the TIMSS 2015 framework and assessment development process (see Developing the TIMSS 2015 Achievement Items), and collaborated with

Statistics Canada and the IEA DPC to develop a plan to implement the TIMSS 2015 sampling design within the country or benchmarking entity (see Sample Implementation).

Following the development of the draft achievement items and context questionnaires, all countries conducted a full-scale field test of all instruments and operational procedures in March-April 2014 in preparation for the TIMSS 2015 data collection, which took place in October-December 2014 in Southern Hemisphere countries and in March-May 2015 in Northern Hemisphere countries. The field test allowed the National Research Coordinators and their staff to become acquainted with the operational activities, and the feedback they provided was used to improve the procedures for the data collection. As expected, the field test resulted in some enhancements to survey operations procedures and most definitely contributed to ensuring the successful execution of TIMSS 2015.

As part of ongoing efforts to improve TIMSS operations, the National Research Coordinators were asked to complete a Survey Activities Questionnaire (SAQ), which sought feedback on all aspects of their experience conducting TIMSS 2015. The feedback solicited in the SAQ included an evaluation of the quality of the assessment materials and the effectiveness of the operations procedures and documentation. The results of the TIMSS 2015 Survey Activities Questionnaire are presented in the final section of this chapter.

## TIMSS 2015 Survey Operations Units, Manuals, and Software

To support the National Research Coordinators in conducting TIMSS 2015, the TIMSS \& PIRLS International Study Center provided step-by-step documentation of all operational activities. Organized into a series of units, the Survey Operations Procedures were made available at critical junctures of the project to ensure that NRCs had all the tools and information necessary to discharge their responsibilities.

The Procedures Units were accompanied by a series of manuals for use by School Coordinators and Test Administrators that National Research Coordinators could translate and adapt to their local situations. Consistent with the goal of automating and streamlining procedures wherever possible, the IEA DPC provided NRCs with a range of custom-built software products to support activities, including sampling and tracking classes and students, administering school, teacher, and home questionnaires, documenting scoring reliability, and creating and checking data files. The TIMSS \& PIRLS International Study Center and the IEA DPC also provided NRCs and their staff with intensive training in constructed response item scoring and data management.

The Survey Operations Procedures units were crucial resources for the National Research Coordinators as the units described in detail the tasks the NRCs were responsible for conducting. In the event that some of these tasks were contracted out to other people or organizations, the units ensured that the NRCs had sufficient knowledge of these matters to supervise the activities of the people who helped conduct the assessment in their countries.

The following units, manuals, and software systems were provided for administering TIMSS 2015:

- TIMSS 2015 Survey Operations Procedures Unit 1: Sampling Schools and Obtaining their Cooperation
- TIMSS 2015 Survey Operations Procedures Unit 2: Preparing for and Conducting the TIMSS 2015 Field Test. Unit 2 consisted of the following four sections: Sampling Classes and Field Test Administration, Preparing Achievement Booklets and Background Questionnaires, Scoring the Constructed Response Items, and Creating the Databases. Unit 2 was accompanied by field test versions of the School Coordinator Manual, Test Administrator Manual, National Quality Control Monitor Manual, and three software systems (WinW3S, IEA DME, and IEA OSS - described below).
- TIMSS 2015 Survey Operations Procedures Unit 3: Contacting Schools and Sampling Classes for the Data Collection. Unit 3 was accompanied by the School Coordinator Manual and the Windows ${ }^{\circledR}$ Within-school Sampling Software (WinW3S) and its manual. The WinW3S software enabled TIMSS 2015 participants to randomly select classes in each sampled school and document in detail the class selection process. The software also was used to track school, teacher, student, and student-teacher linkage information; prepare the survey tracking forms (described later in this chapter); and assign test instruments to students, including printing labels for all the test booklets and questionnaires.
- TIMSS 2015 Survey Operations Procedures Unit 4: Preparing Achievement Booklets and Context Questionnaires. Unit 4 was accompanied by the IEA Online SurveySystem (OSS) and its manual. The IEA Online SurveySystem supported the online administration of the school, teacher, and home (Early Learning Survey for TIMSS at Grade 4) questionnaires.
- TIMSS 2015 Survey Operations Procedures Unit 5: Conducting the Data Collection. Unit 5 was accompanied by the Test Administrator Manual, National Quality Control Monitor Manual, and the International Quality Control Monitor Manual.
- TIMSS 2015 Survey Operations Procedures Unit 6: Scoring the Constructed Response Items. Unit 6 was accompanied by the TIMSS 2015 Scoring Guides, the IEA Coding Expert Software, the Trend Reliability Scoring Manual, and the Cross-country Reliability Scoring Manual. The IEA Coding Expert Software was used to facilitate the trend and cross-country reliability scoring tasks.
- TIMSS 2015 Survey Operations Procedures Unit 7: Creating the Databases. Unit 7 was accompanied by the IEA Data Management Expert (DME) software, its manual, and codebooks that specified information on the IEA DME data fields in each of the data files. The IEA DME software is used for data entry and data verification.

## TIMSS 2015 Survey Tracking Forms

TIMSS uses a series of tracking forms to document class sampling procedures, assign assessment instruments, and track school, teacher, and student information, including the participation status of the respondents. The tracking forms also facilitate the data collection and data verification process. Five different tracking forms were used for TIMSS 2015:

- Class Listing Form: This form was completed for each sampled school, listing the eligible classes and providing details about the classes, such as the class stream (if applicable), the number of students, and the names of teachers.
- Student-Teacher Linkage Form: This form was completed for each class sampled, listing the names of the students and their teachers, student birth dates, gender, exclusion codes, and linking the students to their teachers.
- Student Listing Form (participants in TIMSS Numeracy only): This form was completed for each class sampled, listing the names of the students, student birth dates, gender, and exclusion codes.
- Student Tracking Form: This form was created for each class assessed and was completed by the Test Administrators during test administration. The Test Administrators used this form to verify the assignment of survey instruments to students and to indicate student participation.
- Teacher Tracking Form: This form was completed for each sampled school to indicate the completion of the Teacher Questionnaires.

## Operations for Data Collection

The following sections describe the major operational activities coordinated by the National Research Coordinators.

- Contacting schools and sampling classes
- Overseeing translation and preparing assessment instruments
- Managing the administration of the TIMSS 2015 assessments
- Scoring of the constructed response items
- Creating the TIMSS 2015 data files

Three other major TIMSS 2015 operational activities-sampling schools, translation and translation verification of the assessment instruments, and layout verification of the assessment instruments—are described in separate sections of the Methods and Procedures in TIMSS 2015 publication (see the Sample Design, Translation and Translation Verification, and Layout Verification chapters).

## Contacting Schools and Sampling Classes

Exhibit 6.1 illustrates the major steps of working with schools to sample classes and prepare for the TIMSS 2015 assessment administration. Once the school samples were drawn, National Research Coordinators were tasked with contacting schools and encouraging them to take part in the assessment. Depending on the national context, this could involve obtaining support from national or regional educational authorities. Survey Operations Procedures Unit 1 outlines suggestions on ways to encourage schools to participate in the assessment.

## Exhibit 6.1: Diagram of the Sampling Procedures and Preparations for the Assessment Administration Implemented by National Centers and Schools

In cooperation with school principals, National Research Coordinators were responsible for identifying and training School Coordinators for all participating schools. A School Coordinator could be a teacher or guidance counselor in the school, or NRCs could appoint a member of the national center to fill this role. In some countries, a School Coordinator from the national center was responsible for several schools in an area. Each School Coordinator was provided with a School Coordinator Manual, which describes their responsibilities. The School Coordinator Manual was prepared by the TIMSS \& PIRLS International Study Center and translated/adapted by National Research Coordinator staff, as necessary.

The responsibilities of the School Coordinator included providing the national center with information on the school; coordinating the date, time, and place for testing; identifying and training a Test Administrator to administer the assessment; coordinating the completion of the TIMSS 2015 tracking forms; distributing questionnaires; and obtaining parental permission (if necessary). School Coordinators also confirmed receipt of all assessment materials, oversaw the security of the assessment materials, and ensured the return of the assessment materials to the national center following the administration of the assessment.

School Coordinators also played a critical role in providing information for the sampling process, providing the national center with data on eligible classes in the school. With this information, the national centers used the Within-school Sampling Software (WinW3S) to sample class(es) within the school. WinW3S tracked school, teacher, and student information, and the software generated the necessary tracking forms and instrument labels facilitating the assessment administration process as well as data checking during the data cleaning process.

As TIMSS samples intact classes, one of the roles of the School Coordinator was to ensure that every student in the school was listed in one and only one class (course). This was necessary to ensure that the sample of classes results in a representative sample of students, and every student at the target grade has a chance of being selected. At fourth grade in most countries, students are taught mathematics and science in the same classroom, and therefore the fourth grade classroom was designated as the sampling unit. At the eighth grade, however, in many countries students are grouped differently for mathematics and science instruction. In other words, a student may take mathematics with one group of students and science with a different group of students. As the sampling required one set of students who could be considered a classroom, eighth grade classrooms usually were defined on the basis of mathematics instruction for the purposes of sampling.

## Overseeing Translation and Preparing Assessment Instruments

National Research Coordinators also were responsible for preparing the assessment instruments (achievement booklets and context questionnaires) for their countries-a process that included overseeing the translation of the assessment instruments. The overarching goal of assessment instrument preparation is to create internationally comparable achievement booklets and context questionnaires that are appropriately adapted for the national context.

Each student was assigned one of 14 TIMSS achievement booklets (see the TIMSS 2015 Assessment Frameworks for more information on the matrix sampling design). The achievement booklets are composed of blocks of assessment items, with each block appearing in two booklets. From an operational perspective, each block needed to be translated only once, even though it was included in two different booklets. Adobe ${ }^{\ominus}$ InDesign ${ }^{\oplus}$ software is used by countries to link the translated and adapted assessment blocks to the appropriate booklets. Automating this process through Adobe ${ }^{\otimes}$ InDesign ${ }^{\ominus}$ decreased the chances of human error in the production process.

Twelve new assessment blocks at each grade level were developed for TIMSS 2015 (six mathematics and six science). The new assessment blocks replaced the ones released at the end of the previous assessment cycle. Also, eight new mathematics assessment blocks were developed for TIMSS Numeracy 2015. The new assessment items were tried out through the field test in order to investigate the psychometric characteristics of the achievement items and make well-informed decisions about the best items. Similarly, the context questionnaires were evaluated following the field test to gauge the validity and reliability of the various questionnaire scales.

TIMSS field tests around twice the number of items needed to fill the new assessment blocks. All participating countries and benchmarking entities translated and/or adapted the newly developed items into the test administration language(s) and did the same for the questionnaires. After the field test, the best assessment items were chosen for the main data collection and some edits were applied to both items and the questionnaires.

National Research Coordinators were responsible for applying these changes to the translated assessment items and questionnaires. Countries taking TIMSS at the fourth and/or eighth grade that did not participate in TIMSS 2011 or TIMSS 2007 had to translate and/or adapt the assessment blocks used in previous assessments (trend blocks) into their language(s) in preparation for the 2015 assessment administration. Countries that had participated in TIMSS 2007 and/or TIMSS 2011 were required to use the same translations they used in those cycles.

For both the field test and main data collection, the participating countries received the international version (English) of the achievement booklets and context questionnaires with all the necessary instrument production files, including fonts and graphics files. Instructions on how to use the materials to produce high-quality, standardized instruments, were included in the corresponding Survey Operations Procedures unit. The IEA Secretariat and the TIMSS \& PIRLS International Study Center also provided a generic Arabic source version of the TIMSS 2015 assessment booklets and context questionnaires. Individual countries adapted the generic source version to local usage.

Once translated and/or adapted, first for the field test and then again for the main data collection, the achievement items and context questionnaires were submitted to the IEA Secretariat for translation verification. The IEA Secretariat worked with independent translators to evaluate each country's translations and when deemed necessary suggested changes to the text.

After the translations and adaptations had been verified by the IEA Secretariat, National Research Coordinators assembled the achievement booklets and context questionnaires using Adobe ${ }^{\oplus}$ InDesign ${ }^{\oplus}$ software, and print-ready copies of the instruments were sent to the TIMSS \& PIRLS International Study Center for layout verification and a final review of national adaptations. This review checked that each booklet and questionnaire conformed to the international format and that any adaptations made to the instruments did not unduly influence their international comparability.

## National Adaptations Forms (NAFs)

While preparing national achievement booklets and context questionnaires, countries sometimes by necessity made adaptations to the international versions. All national adaptations to the international assessment instruments, other than direct translation, were documented using the National Adaptations Forms. There is a separate set of NAFs for the achievement booklets and for the context questionnaires (per grade/assessment). During the translation verification and layout review, the verifiers checked whether the national adaptations were likely to influence the ability to produce internationally comparable data for the items involved. Any questions raised were directed to the NRC for consideration via the NAFs.

The NAFs were completed and reviewed at various stages of preparing national assessment instruments. Version I of the forms was completed during the internal translation and review process and sent along with the rest of the materials for international translation verification. After translation verification, the forms (Version II) were updated in response to the translation verifier's comments and reflecting any changes resulting from the verification, and sent along with the national assessment instruments for layout verification. Following layout verification, the national instruments and NAFs were finalized (Version III) and submitted to the IEA Secretariat, the TIMSS \& PIRLS International Study Center, and the IEA DPC as the final documentation of the national adaptations.

## Managing the Administration of the TIMSS 2015 Assessments

Printing assessment materials and distributing them to the participating schools required careful organization and planning on the part of the National Research Coordinator. Each student was assigned one of 14 achievement booklets according to a systematic distribution plan implemented by the WinW3S sampling software. This process is facilitated by the tracking forms and labels generated by WinW3S.

Each student also was assigned a Student Questionnaire, which was labeled so that it could be linked to the achievement booklet. For TIMSS at the fourth grade and for TIMSS Numeracy, the student's parents were assigned the Early Learning Survey, which also was linked to the achievement booklet. In addition, an individually labeled Teacher Questionnaire was sent to each teacher listed on the Teacher Tracking Form and a School Questionnaire was sent to the principal. These materials were packaged and sent to the School Coordinators prior to the testing date, giving
ample time for the School Coordinators to confirm the receipt and correctness of the materials. The School Questionnaire and Teacher Questionnaires were then distributed, while the other instruments were kept in a secure room until the testing date.

Each sampled class was assigned a Test Administrator who followed procedures described in the Test Administrator Manual to administer the achievement booklets and Student Questionnaire. This person was chosen and trained by the School Coordinator. In many cases, the School Coordinator doubled as the Test Administrator. The Test Administrator was responsible for distributing materials to the appropriate students, reading to the students the instructions provided in the Test Administrator's manual, and timing the sessions.

The Test Administrator documented the timing of the testing sessions on the Test Administration Form. The Test Administration Form also solicited information about anything out of the ordinary that took place during assessment administration.

The achievement booklets contained two sections, and the time allotted for each section of the assessment was standardized and strictly enforced by the Test Administrator. There was a required break in between the two sections of the assessment administration, and this break was not to exceed 30 minutes. To complete each part of the TIMSS achievement test, fourth grade students were allowed 36 minutes and eighth grade students were allowed 45 minutes. If a student completed part 1 or part 2 of the assessment before the allotted time, the student was not allowed to leave the testing room. Students completing the assessments early were asked to review their answers or read quietly, and some test administrators provided an activities sheet for the student.

To complete the Student Questionnaire, students were given at least 30 minutes, but extra time was given when necessary. Also, for fourth grade students, the Test Administrator was permitted to read the questionnaire items aloud together with the students.

The Test Administrator was required to use the Student Tracking Form and labels to distribute the booklets to the correct students and to document student participation. If the participation rate was below 90 percent in any class, it was the School Coordinator's responsibility to hold a makeup session for the absent students before returning all of the testing materials to the national center.

## Linking Students to their Teachers and Classes

Exhibit 6.2 illustrates the hierarchical identification system codes that are used to link the data among schools, classes, students, and teachers. The school, class, and student IDs are strictly hierarchical, with classes nested within schools and students nested within classes.

Exhibit 6.2: Hierarchical Identification System Codes Used to Link Schools, Classes, Students, and Teachers

| Participant | ID Components | ID Structure | Numeric Example |
| :--- | :--- | :--- | :---: |
| School | School | CCCC | 0001 |
| Class | School + Class within the school | CCCCKK | 000101 |
| Student | School + Class within the school + Student <br> within the class | CCCCKKSS | 000102 |
| Teacher | School + Teacher within the school + Linkage <br> number to the sampled class | CCCCTTLL | 00010101 |

Each teacher is assigned a teacher identification number consisting of the four-digit school number followed by a two-digit teacher number. Since a teacher could be teaching mathematics and/or science to some or all of the students in a class, it is necessary to have a unique identification number for each teacher linked to a class and to certain students within the class. This is achieved by adding a two-digit link number to the six digits of the teacher identification number to create a unique eight-digit identification number.

## Online Administration of the School, Teacher, and Home Questionnaires

Countries could choose to administer the school, teacher, and/or home questionnaires online. The benefits of administering the questionnaires online included saving money and time in printing, and improving the efficiency of questionnaire distribution, data entry, and data cleaning.

For the online administration of the questionnaires, the IEA DPC provided its IEA Online SurveySystem software that incorporates design, presentation, and monitoring components.

The design component, known as the Designer, supports the preparation of the online surveys, data management, and data output to the IEA DPC. Through the IEA Online SurveySystem Designer component, national centers could tailor the online questionnaires to their national language. To facilitate translation and adaptation, the Designer concurrently stored the original English question text and the translations and/or national adaptations. It also stored the variable names and data validation rules. If a national center decided not to administer a particular international question or option, it could be disabled in the Designer and would not be administered during the online questionnaire administration. The Designer also included an integrated preview function to allow for a visual side-by-side comparison of the paper/PDF and online versions of the questionnaires, facilitating the layout verification process.

For the online presentation, the Web Component presents the questionnaires to the respondents. The navigation capabilities of the Web Component are designed to allow respondents to pick and choose their order of response. Buttons marked "next" and "previous" facilitated navigation between adjacent pages, so users could browse through the questionnaire in the same way that they flip through the pages of the paper questionnaire. A hyperlinked interactive "table
of contents" allowed the respondents to fluidly navigate to specific questions. Overall, these two functions permitted the respondents to answer questions in the order of their choosing, and skip questions just as they could do if they were answering the paper questionnaire. Also, the online questionnaires could be accessed through any standard Internet browser on all standard operating systems without the user needing any additional software.

Finally, the Web-based Monitor component allows for monitoring the survey responses in real time. Many national centers made extensive use of the Web-based Monitor to follow-up with non-respondents.

The IEA Data Processing and Research Center followed a stringent set of procedures in order to safeguard the confidentiality of the respondents and maintain the integrity of the data. Each respondent received a statement of confidentiality, and information on how to access the online questionnaire. For most countries, the online questionnaire administration was hosted on the IEA DPC's customized high-performance server. The IEA DPC server allowed for the 24 -hour availability of the questionnaires during the data-collection period, and it also ensured backup and recovery provisions for the data.

## Scoring the Constructed Response Items

Constructed response items represent a substantial portion of the TIMSS assessments, and because reliable and valid scoring of these items is critical to the assessment results, the TIMSS \& PIRLS International Study Center provided explicit scoring guides and extensive training in their use. Also, the Survey Operations Procedures units specified a procedure for efficiently organizing and implementing the scoring activity.

International scoring training sessions (one for the field test and two for the main data collection-one for Southern Hemisphere countries and another for Northern Hemisphere countries) were conducted where all National Research Coordinators (or country representatives appointed by the NRCs) were trained to score each of the constructed response items. At these training sessions, the scoring guide for each item was reviewed and applied to a sample set of example student responses that had already been scored. These example papers were actual student answers from pilot testing in several English-speaking countries and were chosen to represent a range of response types and to demonstrate the guides as clearly as possible. Following the example papers, the training participants applied the scoring guides to a different set of student responses that had not yet been scored. The scores to these practice papers were then shared with the group and any discrepancies were discussed.

Following the international scoring training, national centers trained their scoring staff on how to apply the scoring guides for the constructed response items. National Research Coordinators were encouraged to create additional example papers and practice papers from student responses collected in their country.

## Documenting Scoring Reliability

Because reliable scoring of the constructed response items is essential for high quality TIMSS data, it is important to document the reliability of the scoring process. A high degree of scorer agreement is evidence that scorers have applied the scoring guides in the same way. The procedure for scoring the TIMSS 2015 constructed response items provided for documenting scoring reliability within each country (within-country reliability scoring), across countries (cross-country reliability scoring), and over time (trend reliability scoring).

The method for establishing the reliability of the scoring within each country was for two independent scorers to score a random sample of 200 responses for each constructed response item. The degree of agreement between the scores assigned by the two scorers is a measure of the reliability of the scoring process. In collecting the within-country reliability data, it was vital that the scorers independently scored the items assigned to them, and each scorer did not have prior knowledge of the scores assigned by the other scorer. The within-country reliability scoring was integrated within the main scoring procedure and ongoing throughout the scoring process.

The purpose of the trend reliability scoring was to measure the reliability of the scoring from one assessment cycle to the next (i.e., from TIMSS 2011 to TIMSS 2015). The trend reliability scoring required scorers of the current assessment to score student responses collected in the previous cycle. The scores of the current cycle were then compared with the scores awarded in the previous assessment cycle. Trend reliability scoring was conducted using the IEA Coding Expert Software provided by the IEA DPC.

Trend reliability scoring for TIMSS 2015 involved eight secured item blocks. Student responses included in the trend reliability scoring (150-200 responses per item) were actual student responses collected during the previous assessment cycle in each country and benchmarking entity. These responses were scanned and provided for each participating country and benchmarking entity along with the IEA Coding Expert Software. All scorers who scored the trend assessment blocks in 2015 were required to participate in the trend reliability scoring. If all scorers were trained to score all trend items, the software divided the student responses equally among the scorers. If scorers were trained to score specific item blocks, National Research Coordinators were able to specify within the software which scorers would score particular item blocks, and the software allocated the student responses accordingly. Similar to the within-country reliability scoring, the trend reliability scoring had to be integrated within the main scoring procedure.

Finally, cross-country reliability scoring gave an indication about how consistently the scoring guides were applied from one country to the next. The cross-country reliability scoring also was conducted using IEA Coding Expert Software. To begin the process, the IEA DPC compiled actual responses of students from English speaking countries participating in the previous TIMSS cycle. Cross-country reliability scoring included 21 items at the fourth grade and 26 items at the eighth grade. Two hundred student responses for each item were scanned by the IEA DPC and provided to
countries and benchmarking entities along with the IEA Coding Expert Software. All scorers who could score student responses written in English were required to participate in the cross-country reliability scoring, and the student responses were equally divided among the participating scorers in each country. The scoring exercise was completed immediately after all other scoring activities.

## Creating the TIMSS 2015 Databases

The data entry process took place March-May 2014 for the field test, from December 2014March 2015 following data collection in the Southern Hemisphere and June-September 2015 following data collection in the Northern Hemisphere. The procedure for creating the TIMSS 2015 databases included entering sampling and assessment administration information into the WinW3S database and adding responses from the context questionnaires and achievement booklets using the IEA Data Management Expert (DME) software.

The IEA DPC provided DME software to accommodate keyboard data entry and data verification. The DME software also offers data and file management capabilities, a convenient checking and editing mechanism, interactive error detection, and quality-control procedures. For the TIMSS 2015 context questionnaires administered online on the IEA DPC's server, the data were directly accessible by the IEA DPC and no further data entry was required.

Along with the DME software, the IEA DPC provided international codebooks describing all variables and their characteristics, thus ensuring that the data files met the internationally defined rules and standards for data entry. The files within the DME database for entering the TIMSS 2015 data were based on these codebooks. However, the codebooks had to match exactly the national assessment instruments so that the answers of the respondents could be entered properly. Therefore, any adaptations to the international instruments also required adaptations to the international codebooks. The adapted national codebooks then were used to create the TIMSS 2015 data files in each country, with the responses to the context questionnaires, achievement booklets, and Reliability Scoring Sheets keyed into the DME database.

Quality control throughout the data entry process was essential to maintain accurate data. Therefore, National Research Coordinators were responsible for performing periodic reliability checks during data entry and for applying a series of data verification checks provided by both WinW3S and DME software prior to submitting the databases to the IEA DPC. To ensure the reliability of the data entry process, the data-entry staff was required to double enter at least 5 percent of each instrument type. An error rate of 1 percent or less was acceptable for the background files. An error rate of 0.1 percent or less was required for the student achievement files and the reliability scoring files. If the required agreement was not reached, retraining of the key punchers was required.

Additionally, the data verification module of WinW3S and DME identified a range of problems, such as inconsistencies of identification codes and out-of-range or otherwise invalid
codes. The data quality control procedures also verified the integrity of the linkage between the students, teachers, and schools entered into the DME database and tracking of information for those specified in WinW3S.

When all data files had passed the quality control checks, they were submitted to the IEA DPC, along with data documentation, for further checking and processing. For information on data processing at the IEA DPC, please refer to the Creating the International Databases chapter of this publication.

## TIMSS 2015 Survey Activities Questionnaire

The Survey Activities Questionnaire was designed to elicit information about NRCs' experiences in preparing for and conducting the TIMSS 2015 data collection. The questionnaire was composed of six sections and focused on the following:

- Sampling schools and classes
- Preparing assessment instruments
- Administering the assessments
- Implementing the National Quality Control Program
- Preparing for and scoring the constructed response items
- Creating the databases

All items in the Survey Activities Questionnaire included accompanying comment fields, in which NRC respondents were encouraged to explain their responses, provide additional information, and suggest improvements in the process.

The TIMSS 2015 Survey Activities Questionnaire was administered online via the IEA's Online SurveySystem and was completed by a total of 59 NRCs. The following sections summarize information gathered from the Survey Activities Questionnaire, reflecting the quality of the TIMSS 2015 survey materials and procedures in the participating countries.

## Sampling Schools and Classes

The first section of the Survey Activities Questionnaire asked NRCs about the Survey Operations Procedures for sampling both schools and classes within the sampled schools. As shown in Exhibit 6.3, all of the countries considered that Survey Operations Procedures Units 1 and 3 were clear and sufficient. Seven countries reported deviating from the basic TIMSS sampling design. Their reasons for these modifications to the sampling procedures included allowing for census participation, oversampling certain regions, and changing the target grade from previous cycles. One country reported selecting their TIMSS 2015 school sample at the national center in collaboration with Statistics Canada. Statistics Canada in cooperation with the IEA DPC selected the school samples for all other countries.

## Exhibit 6.3: Survey Activities Questionnaire, Section One-Sampling (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :--- | :---: | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2015 Survey <br> Operations Procedures Unit 1 - Sampling Schools and <br> Obtaining their Cooperation" clear and sufficient? | 58 | 0 | 1 |
| Were there any conditions or organizational constraints that <br> necessitated deviations from the basic TIMSS sampling design <br> described in the "Survey Operations Procedures Unit 1"? | 7 | 51 | 1 |
| Did you use the Within-school Sampling Software (WinW3S) to <br> sample classes? | 57 | 0 | 2 |
| Did you experience any problems orinconveniences when <br> using the WinW3S software? | 16 | 40 | 2 |
| Was the information provided in the "TIMSS 2015 Survey <br> Operations Procedures Unit 3 - Contacting Schools and <br> Sampling Classes for the Data Collection" clear and sufficient? | 58 | 0 | 2 |
| Did you follow the procedures outlined in "Survey Operations <br> Procedures Unit 3" for working with the schools to sample <br> classes (e.g., using the appropriate tracking forms in <br> the proposed order to obtain information from School <br> Coordinators)? | 47 | 10 | 2 |

All countries selected classes within the sampled schools using the Windows ${ }^{\circ}$ Withinschool Sampling Software (WinW3S), provided by the IEA Data Processing and Research Center. Countries administering both the TIMSS fourth grade and TIMSS Numeracy achievement booklets encountered some organizational constraints in their systems that necessitated a modification to the sample design, and these countries also experienced some problems using the WinW3S software. Countries also noted that the WinW3S software was slow at times.

Ten NRCs applied some modifications to the procedures outlined in the Survey Operations Procedures Unit 3. For example, some NRCs did not use the Class Listing Forms because all classes at the target grade were tested or because a class level database was available at the ministry, and a number of countries did not use the fourth grade Teacher Tracking Forms because there was only one teacher per class. All modifications were reviewed and approved by the TIMSS \& PIRLS International Study Center.

## Translating, Adapting, and Producing Assessment Instruments

The second section of the Survey Activities Questionnaire asked NRCs about translating, adapting, assembling, and printing the test materials, as well as issues related to checking the materials and securely storing them. In the majority of cases, NRCs reported applying corrections to their survey instruments as suggested by the external translation verifier or the layout verifier.

As reported in Exhibit 6.4, all of the NRCs answered that they were able to assemble the test booklets and questionnaires according to the instructions provided. However, 10 countries reported
experiencing some problems using the survey instrument production materials. These problems mostly included the following: issues with fonts and special characters (e.g., for Cyrillic alphabet), difficulty fitting longer national text in the context questionnaires, and some problems with the layout style of tables. All of the identified problems were resolved either by specialists at the national center or with assistance from the TIMSS \& PIRLS International Study Center.

Exhibit 6.4: Survey Activities Questionnaire, Section Two-Translating, Adapting, and Producing Assessment Instruments (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2015 Survey Operations Procedures Unit 4 - Preparing Achievement Booklets and Context Questionnaires" clear and sufficient? | 55 | 3 | 1 |
| Did you encounter any major problems using the assessment instrument production materials (e.g., instrument production files, fonts, support materials) provided by the TIMSS \& PIRLS International Study Center? | 10 | 48 | 1 |
| After the translation verification, did you correct your translations/adaptations as suggested by the verifier in the majority of cases? |  |  |  |
| TIMSS eighth-grade booklets | 38 | 0 | 4 (Not Answered) <br> 17 (Not Applicable) |
| TIMSS fourth-grade booklets | 46 | 1 | 4 (Not Answered) <br> 8 (Not Applicable) |
| TIMSS Numeracy booklets | 8 | 0 | 4 (Not Answered) <br> 47 (Not Applicable) |
| Eighth-grade context questionnaires | 38 | 0 | 4 (Not Answered) <br> 17 (Not Applicable) |
| Fourth-grade context questionnaires | 49 | 0 | 4 (Not Answered) <br> 6 (Not Applicable) |
| After the layout verification, did you correct your assessment instruments as noted by the verifier in the majority of cases? |  |  |  |
| TIMSS eighth-grade booklets | 39 | 0 | 3 (Not Answered) <br> 17 (Not Applicable) |
| TIMSS fourth-grade booklets | 47 | 1 | 3 (Not Answered) <br> 8 (Not Applicable) |
| TIMSS Numeracy booklets | 8 | 0 | 3 (Not Answered) <br> 48 (Not Applicable) |
| Eighth-grade context questionnaires | 39 | 0 | 3 (Not Answered) <br> 17 (Not Applicable) |
| Fourth-grade context questionnaires | 50 | 0 | 3 (Not Answered) <br> 6 (Not Applicable) |
| Did you apply any quality control measures to check the achievement booklets and context questionnaires during the printing process (e.g., checking for missing pages, upside down pages, text too bright or too dark)? | 54 | 2 | 3 |

# Exhibit 6.4: Survey Activities Questionnaire, Section Two-Translating, Adapting, and Producing Assessment Instruments (Numbers of NRC Responses) (Continued) 

| Question | Yes | No | Not Answered |
| :--- | :---: | :---: | :---: |
| Did you take measures to protect the security of the <br> assessment instruments during the translation, assembly, and <br> printing process? | 57 | 0 | 2 |
| Did you detect any potential breaches in security of the <br> assessment instruments? | 1 | 56 | 2 |
| Did you encounter any problems preparing the Online <br> SurveySystem files for administering the school, teacher, and/or <br> home (Early Learning Survey) questionnaires online? | 5 | 14 | 3 (Not Answered) |

Nearly all of the countries conducted the recommended quality control checks during the process of printing the testing materials. The most common errors that countries detected and fixed during the printing process were pages that were missing or in the wrong order. One country expressed concerns about a breach of security, as the courier lost one package with the materials.

Five countries reported that they experienced problems with the Online SurveySystem. These problems were related to structural national adaptations, the national text being much longer than the original text in English, a very tight timeline for Southern Hemisphere countries, and some valid ranges (e.g., calendar dates) not being restricted.

## Assessment Administration

The third section of the Survey Activities Questionnaire addressed the extent to which NRCs detected errors in the testing materials during packaging for shipment to schools. As shown in Exhibit 6.5, a small number of errors were found in the materials. About half of such errors were discovered before distributing materials to schools and fixed prior to their distribution. Errors found after distribution usually were very minor, and either were fixed by school coordinators or replacement materials were provided. The few cases where the errors could not be remedied were reported to the TIMSS \& PIRLS International Study Center, where decisions were made about setting the problematic data to "Not Administered."

## Exhibit 6.5: Survey Activities Questionnaire, Section Three—Assessment Administration (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2015 Survey Operations Procedures Unit 5 - Conducting the Data Collection" clear and sufficient? | 57 | 0 | 2 |
| Were any errors detected in any of the following assessment materials after they were sent to schools? |  |  |  |
| Achievement booklets | 18 | 38 | 3 (Not Answered) <br> 0 (Not Applicable) |
| Achievement booklet ID labels | 7 | 49 | 3 (Not Answered) <br> 0 (Not Applicable) |
| Student Questionnaires | 5 | 51 | 3 (Not Answered) <br> 0 (Not Applicable) |
| Student Questionnaire ID labels | 5 | 50 | 3 (Not Answered) <br> 1 (Not Applicable) |
| Early Learning Surveys | 1 | 48 | 3 (Not Answered) <br> 7 (Not Applicable) |
| Early Learning Survey ID labels | 4 | 45 | 3 (Not Answered) <br> 7 (Not Applicable) |
| Student Tracking Forms | 6 | 50 | 3 (Not Answered) <br> 0 (Not Applicable) |
| Teacher Questionnaires | 5 | 49 | 3 (Not Answered) <br> 2 (Not Applicable) |
| Teacher Tracking Forms | 2 | 51 | 3 (Not Answered) <br> 3 (Not Applicable) |
| School Questionnaires | 2 | 52 | 3 (Not Answered) <br> 2 (Not Applicable) |
| School Coordinator Manuals | 1 | 54 | 3 (Not Answered) <br> 1 (Not Applicable) |
| Test Administrator Manuals | 3 | 52 | 3 (Not Answered) <br> 1 (Not Applicable) |
| If any errors were detected, did you correct the error(s) before the testing began? | 15 | 24 | 2 (Not Answered) <br> 18 (Not Applicable) |
| Does your country have a confidentiality policy that restricts putting student names on tracking forms and survey instrument covers? | 16 | 41 | 2 |
| Did you encounter any problems translating and/or adapting the School Coordinator Manual(s)? | 2 | 55 | 2 |
| Did you encounter any problems translating and/or adapting the Test Administrator Manual(s)? | 1 | 55 | 3 |
| Were School Coordinators appointed from within the participating schools? | 50 | 7 | 2 |
| Did you hold formal training session(s) for School Coordinators? | 33 | 24 | 2 |

## Exhibit 6.5: Survey Activities Questionnaire, Section Three—Assessment Administration (Numbers of NRC Responses) (Continued)

| Question | Yes | No | Not Answered |
| :--- | :---: | :---: | :---: |
| Were Test Administrators trained by School Coordinators within <br> the participating schools? | 25 | 32 | 2 |
| Did Test Administrators document any problems or <br> special circumstances that occurred frequently during the <br> assessment administration (please refer to the completed Test <br> Administration Forms)? | 20 | 36 | 3 |
| If you administered school, teacher, and/or home (Early <br> Learning Survey) questionnaires online, did any of the <br> respondents in your country encounter any problems <br> responding to the online questionnaires? | 9 | 11 | 2 2 (Not Answered) |

Three NRCs reported difficulties translating the School Coordinator Manual and/or the Test Administrator Manual. Primarily, problems arose when the manual(s) had to be reorganized or adapted, and the standardized procedures were modified (e.g., no Class Listing Forms or Teacher Tracking Forms were used).

In 50 countries, School Coordinators were appointed within the participating schools, and in 25 of these countries, Test Administrators were trained by the School Coordinators. In the remaining countries, School Coordinators and/or Test Administrators either were from the national center or were contracted externally. In most countries, the National Research Coordinators organized training sessions for School Coordinators. In some, mostly larger countries, training was conducted either online or in a written form via extended manuals.

Among the problems documented by Test Administrators during assessment administration were the following: loud noises outside the classroom, many students asking questions, too much time, not enough time, and student complaints that the test was too difficult.

## National Quality Control Program

The fourth section of the Survey Activities Questionnaire addressed the national quality control program that each country implemented during data collection. As part of the national quality assurance activities, NRCs were instructed to send National Quality Control Observers to 10 percent of the participating schools in order to observe test administration and document compliance with prescribed procedures. Due primarily to budgetary constraints, some countries sent national monitors to less than ten percent of participating schools, and three countries did not send monitors to any of the testing sessions.

As shown in Exhibit 6.6, when applicable, almost all of the national centers conducted their quality assurance program using the National Quality Control Monitor Manual provided by the TIMSS \& PIRLS International Study Center. Among the few documented problems detected by the national monitors were students complaining about the length of the Student Questionnaire. In addition, one case was noted where the national monitor felt the Test Administrator was unprepared.

## Exhibit 6.6: Survey Activities Questionnaire, Section Four-National Quality Control Program (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :--- | :---: | :---: | :---: |
| Did you conduct a national quality control program that <br> observed the data collection in the participating schools? | 52 | 5 | 2 |
| Did you use the National Quality Control Monitor (NQCM) <br> Manual and the Classroom Observation Record provided by <br> the TIMSS \& PIRLS International Study Center to conduct your <br> national quality control program? | 49 | 4 | 3 (Not Answered) <br> 3 (Not Applicable) |
| Did your national quality control monitors (NQCMs) document <br> any major problems or special circumstances that occurred <br> frequently during the assessment administration? | 3 | 49 | 4 (Not Answered) |

## Preparing for and Scoring the Constructed Response Items

Exhibit 6.7 provides data on responses to items asking NRCs about their experiences preparing for and scoring the constructed response items. Almost all NRCs found the scoring procedures as explained in the Survey Operations Procedures Unit 6-Scoring the Constructed Response Items to be clear and sufficient. Some countries reported that they would have liked to have scoring training practice materials for all items instead of select group of items. Countries reporting problems with the scoring training materials asked for more "borderline" examples including more detailed explanations within the scoring guides. All of the NRCs reported creating their own national examples and practice papers for training their scorers, as suggested by the TIMSS \& PIRLS International Study Center.

Exhibit 6.7: Survey Activities Questionnaire, Section Five—Preparing for and Scoring the Constructed Response Items (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :--- | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2015 Survey <br> Operations Procedures Unit 6 - Scoring the Constructed <br> Response Items" clear and sufficient? | 55 | 2 | 2 |
| Did you encounter any problems using the scoring training <br> materials, provided by the TIMSS \& PIRLS International Study <br> Center? | 11 | 46 | 2 |
| Did you create national scoring training materials in addition to <br> the international scoring training materials? | 41 | 16 | 2 |
| Did you scan the achievement booklets for electronic image <br> scoring? |  | 26 | $2($ (Not Answered) <br> TIMSS eighth-grade booklets |
| TIMSS fourth-grade booklets Applicable) |  |  |  |

## Exhibit 6.7: Survey Activities Questionnaire, Section Five—Preparing for and Scoring the Constructed Response Items (Numbers of NRC Responses) (Continued)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Did you encounter any problems during the Trend Reliability Scoring? |  |  |  |
| Procedural problems | 1 | 51 | 2 (Not Answered) <br> 5 (Not Applicable) |
| Technical, software related problems | 10 | 42 | 2 (Not Answered) <br> 5 (Not Applicable) |
| Did all your scorers participate in scoring student responses of the trend items? | 30 | 21 | 3 (Not Answered) <br> 5 (Not Applicable) |
| Did you encounter any problems during the Cross-country Reliability Scoring? |  |  |  |
| Procedural problems | 5 | 47 | 4 (Not Answered) <br> 3 (Not Applicable) |
| Technical, software related problems | 9 | 43 | 4 (Not Answered) <br> 3 (Not Applicable) |
| Did all your scorers participate in the Cross-country Reliability Scoring? | 17 | 36 | 3 (Not Answered) <br> 3 (Not Applicable) |

Eleven countries administering the eighth-grade assessment and 16 countries administering the fourth-grade assessment scanned their achievement booklets and scored student responses electronically. Some technical problems were encountered while using the Coding Expert Software and this feedback will be used by the IEA DPC to continue to improve the software. Because English was used for the cross-country reliability scoring task, three countries were unable to participate. For those countries that did not participate in the previous cycle of TIMSS, the question on the trend reliability scoring procedures did not apply.

## Creating the Databases

The last section of the Survey Activities Questionnaire addressed data entry and quality control activities. As shown in Exhibit 6.8, all of the NRCs found the instructions in the Survey Operations Procedures Unit 7 to be clear and sufficient. Some NRCs expressed a wish for a more automated data entry process in WinW3S (especially for entering the testing dates and time) and would like to have more detailed instructions on importing tables with information for multiple schools, teachers, and/or students. Most countries reported hiring temporary data entry staff to enter data manually, and a number of countries used optical scanning instead of manual data entry. A very positive finding of the TIMSS 2015 Survey Activities Questionnaire is that multiple countries reported exceeding the five percent requirement for double entry of each assessment instrument, with a couple of countries entering all of the instruments twice. All countries reported applying all required data quality checks.

## Exhibit 6.8: Survey Activities Questionnaire, Section Six—Creating Databases (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2015 Survey Operations Procedures Unit 7 - Creating the Databases" clear and sufficient? | 55 | 0 | 4 |
| Did you encounter any problems entering test administration information and exporting your WinW3S database(s)? | 19 | 36 | 4 |
| Who primarily entered the data for your country? |  |  |  |
| National center staff | 13 | - | 0 |
| Temporarily hired data entry staff | 24 | - | 0 |
| An external data entry firm | 8 | - | 0 |
| Combination of the above | 8 | - | 0 |
| Other | 4 | - | 2 |
| Did you use manual (key) data entry to create the data files for your country? |  |  |  |
| TIMSS achievement booklets | 43 | 12 (Optical Scanning) | 3 (Not Answered) <br> 1 (Not Applicable) |
| Context questionnaires | 44 | 11 (Optical Scanning) | 4 (Not Answered) <br> 0 (Not Applicable) |
| Did you encounter any problems using the IEA's Data Manager Expert (DME) software? | 10 | 45 | 4 |
| If you entered data manually, did you enter $5 \%$ of each survey instrument twice as a quality control measure? | 38 | 8 | 3 (Not Answered) <br> 10 (Not Applicable) |
| Did you apply all the data quality checks described in the "TIMSS 2015 Survey Operations Procedures Unit 7 - Creating the Databases" before submitting your data to the IEA Data Processing and Research Center? | 55 | 0 | 4 |
| Have you stored all achievement booklets and context questionnaires in a secure storage area until the original documents can be discarded? | 56 | 0 | 3 |

## CHAPTER 7

## Translation and Translation Verification for TIMSS 2015

David Ebbs<br>Paulina Korsnakova

## Introduction

This chapter describes the activities and procedures related to countries' preparation of national versions of the TIMSS assessment instruments, focusing on two major activities:

- Translation and adaptation of the international version of the TIMSS assessment instruments into national languages
- International verification of the national translations/adaptations

The TIMSS \& PIRLS International Study Center develops the international versions of the TIMSS assessment instruments in English. Then the Arabic international source version is produced in cooperation with the IEA Secretariat. After the release of the international source versions, all the participating countries are required to translate and/or adapt the international versions into their language(s) of instruction. To ensure that the translated national instruments are equivalent to the international versions, linguistic and assessment experts perform multiple rounds of review based on the international source version in English.

The translation and verification process aims to ensure high quality translations that are internationally comparable and adapted appropriately for each country's context and education system. As part of the TIMSS international quality assurance program, the translation verification process requires that each country's instruments undergo a formal external review of the translations and adaptations prior to the assessments.

All countries are required to follow standard, internationally agreed-upon procedures from the initial translation through final printing of their national instruments. At the national level, countries are responsible for translating and/or adapting the international assessment materials and questionnaires according to the international guidelines for TIMSS, conducting a review of their translations' quality and appropriateness, and documenting all national adaptations for reference at later stages. Even for countries whose survey language is English, national adaptations to the materials are required to accommodate the variations used in different English-speaking countries. Similarly, countries that use the Arabic international source version provided for the TIMSS assessment are expected to implement necessary adaptations to conform to each country's national usage and context.

At the international level, the IEA Secretariat arranges for each country's translated and adapted materials to undergo translation verification. The translation verifiers provide detailed feedback to improve the accuracy of the national instruments compared to the international instruments. When the verified materials are returned, the National Research Coordinators (NRCs) are tasked with reviewing the feedback of translation verification, revising their materials as needed, and updating their documentation for use during data processing and analysis.

The translation and translation verification processes of the assessment materials occur twice-first before the field test and then again before the assessment. The IEA Secretariat manages these processes, which consists of careful documentation of outcomes at the various stages of translation, adaptation, verification, and revision.

Prior to the field test and again before the assessment data collection, the same general verification procedures are followed, with the exception of items designed to measure trends from previous cycles. Trend items undergo a separate verification procedure to ensure consistency across assessment cycles.

The TIMSS assessment materials required to undergo translation verification are:

- Student achievement items (assembled in blocks of items)
- Background questionnaires for school principals, teachers, parents, and students
- Covers and directions (for achievement booklets and paper versions of context questionnaires)
- Online covers and directions (only for online data collection of home, teacher, and school questionnaires)

The TIMSS procedural manuals and scoring guides for the constructed-response items typically are translated but not subject to the international verification procedure.

## Guidelines for Translation and Adaptation

The general purpose of translation and adaptation is to maintain the same meaning and level of difficulty as the international version while following the rules of the target language and the country's cultural context. This includes adapting the international versions in English to English usage in the context of each English speaking country; adapting the Arabic translations to each national education context; and adapting a translation developed by one country to another country's context.

In particular, translators and reviewers are asked to ensure that:

- The translation is at an appropriate level for the target population
- No information is omitted, added, or clarified in the translated text
- The translated text has the same meaning and uses equivalent terminology as the international version
- The translated text has the same register (language level and degree of formality) and level of difficulty as the international version
- Idiomatic expressions are translated appropriately, not necessarily word for word
- The translated text uses correct grammar, punctuation, qualifiers, and modifiers, as appropriate for the target language

After the field test, the TIMSS \& PIRLS International Study Center provides NRCs with a list of changes to the international version that they can refer to while preparing their assessment instruments. This information minimizes the translation burden while highlighting the necessary changes to the translations before the assessment.

## The Target Language

Identifying the language of the assessment (the "target" language) for most countries is relatively straightforward, because there is a dominant language used in both the public and private sectors of society. However, some countries use more than one language of instruction in their educational systems. In such cases, countries translate the student instruments into several target languages to ensure that the assessment can be administered in the language used for teaching in schools. Where the language of instruction may differ from the language commonly used at home, countries may translate the home questionnaire into one or more additional languages (the languages most commonly spoken in the home). This enables parents or caregivers to use the language that they feel most comfortable employing when filling out the questionnaire.

## Scope of Translation and Verification in TIMSS 2015

For the TIMSS 2015 cycle at fourth and eighth grades, a total of 57 countries and seven benchmarking participants prepared 138 sets of achievement tests and 131 sets of background questionnaires in 43 languages.

The TIMSS 2015 assessment instruments were translated into 43 different languages, across 48 participating countries and seven benchmarking entities at the fourth grade, and 40 countries and seven benchmarking entities at the eighth grade. Of these participants, 22 countries and five benchmarking entities administered the instruments in more than one language (most commonly, the achievement test and student questionnaire).

Exhibits 7.1-7.3 list the TIMSS 2015 fourth grade, Numeracy, and eighth grade countries, the target languages identified for each country, and administered instruments. The most common languages used for the TIMSS 2015 assessment were English (21 countries) and Arabic (10 countries), with 22 countries administering all or parts of the assessment in two or more languages.

Exhibit 7.1 Languages Used for the TIMSS 2015 Fourth Grade Assessment Instruments

| Country | Language | Instruments |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Achievement Test | Student Questionnaire | Teacher Questionnaire | School Questionnaire | Home Questionnaire |
| Armenia | Armenian | - | - | - | - | - |
| Australia | English | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
| Bahrain | Arabic | $\bigcirc$ | - | - | - | $\bigcirc$ |
|  | English | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
| Belgium (Flemish) | Dutch | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
| Buenos Aires | Spanish | - | - | - | - | - |
| Bulgaria | Bulgarian | - | - | - | - | - |

|  | English | $\bigcirc$ | - | - | $\bigcirc$ |
| Sweden | Swedish | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
| Thailand | Thai | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | - |
| Turkey | Turkish | $\bigcirc$ | $\bigcirc$ | - | - |
| United Arab Emirates | Arabic | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
|  | English | $\bigcirc$ | $\bigcirc$ | - | - |
|  | Arabic with some English text | $\bigcirc$ |  |  |  |
| United States | English | $\bigcirc$ | - | - | $\bigcirc$ |

1 In Egypt, the eighth grade achievement test in English did not undergo Adaptation/Translation Verification.
2 In Lithuania, the eighth grade achievement test is administered in Russian (from Russian Federation).

## The Translation Process

The TIMSS \& PIRLS International Study Center describes the procedures for translating the achievement items and questionnaires. Each country is responsible for having skilled and experienced translators translate the instruments. To ensure that national versions of the TIMSS instruments are consistent with the international version, the assessment translation guidelines allow for national adaptations where necessary. Following translation of the instruments, one or more qualified reviewers independently review the completed translations to ensure the nationally translated instruments are of the highest quality and student-level appropriate. Some countries employ multiple translators and reviewers, either working together to complete the tasks on schedule, or working independently to provide two or more views. When countries use more than one translator, the country must reconcile the translation differences to ensure that only a single consistently translated set of materials is produced. Similarly, when using more than one reviewer, countries are responsible for ensuring consistency of the reviews across the translated materials. When countries prepare translations in more than one language, professionals proficient in both languages should be involved to ensure equivalency across the translations.

## Translators and Reviewers

Countries are strongly advised to hire highly qualified translators and reviewers who are well suited to the task of working with the TIMSS materials.

Essential qualifications for translators and reviewers include:

- Excellent knowledge of English
- Excellent knowledge of the target language
- Experience in the country's cultural context
- Experience translating texts in the subject areas related to the TIMSS assessment (mathematics and science)

The reviewers primarily are responsible for assessing the readability and accuracy of the translation for the target population. In addition to excellent language skills and knowledge of the country's cultural context, they are expected to have experience with students in the target grade (preferably as a school teacher).

## Providing the Instruments for Translation and Adaptation

The TIMSS \& PIRLS International Study Center provides NRCs with electronic files consisting of all materials to be translated, as well as special forms for documenting each step of the adaptation, translation, and verification processes. According to the TIMSS assessment design, most of the
achievement item blocks appear in more than one booklet, therefore the component parts of the booklets (blocks, covers, and directions) are prepared as separate files to facilitate translation. This approach allows countries to translate each component only once before assembling the booklets. The international instruments are accompanied by detailed manuals and instructional videos for NRCs that provide information on how to work with the electronic files, support materials for right-to-left languages, guidelines for translation and adaptation, and instructions for booklet assembly.

## Translation and Adaptation of the Achievement Test

While translating the TIMSS achievement test, one of the main challenges is finding appropriate terms and expressions in the target language(s) of each country that convey the same meaning and style of text as the international version. When adapting and translating expressions with more contextually appropriate terms, translators must ensure that the meaning and difficulty of the item remains the same as the international version. For example, it is important that adaptation/ translation of an item does not simplify or clarify the text in such a way as to provide a hint or definition of the meaning of a question. Also, translators must ensure the consistency of adaptations and translations from item to item. Similarly, for multiple-choice items, translators are instructed to pay particular attention to the literal and synonymous matches of text in both the question stem and answer options; matches in the international version should be maintained in the translated national version.

Although NRCs are strongly encouraged to keep adaptations to a minimum, some adaptations are necessary in order to prevent students from facing unfamiliar contexts or vocabulary that could hinder their ability to read and understand the item. In some cases, changes to the instruments may be necessary to follow national conventions of measurement, mathematical notation (e.g., decimal separator, multiplication sign), punctuation, and expressions of date and time. For example, a reference to the working week as Monday to Friday might be adapted according to national customs; similarly, a word such as "flashlight" in American English would be adapted to "torch" in British English. In addition, names of fictional characters and places may be modified to similar names in the target language. When the names of fictional cities or towns are adapted, translators are advised against using real place names to prevent students' responses from being influenced by their perception and knowledge of the names.

Some terms in the text are not to be changed or adapted beyond translation. Examples include proper names of actual people and places, as well as the fictional currency "zed" (which is used in the TIMSS items about money). To aid in the standardization of the most common adaptations across countries, the TIMSS \& PIRLS International Study Center provides a list of specific examples of acceptable and unacceptable adaptations, including a list of measurement conversions.

## Blocks of Achievement Items Designated to Measure Trends

According to a carefully specified design, a substantial number of blocks (about 60\%) are carried over to the next cycle (see Chapter 1: Developing the TIMSS Advanced 2015 Achievement Items in Methods and Procedures in TIMSS 2015) for the purpose of measuring changes in student achievement over time. To ensure the quality of the trend measurement, these "trend blocks" must be administered in exactly the same way in every cycle. For countries that previously participated in TIMSS 2011 and/or TIMSS 2007, the translations of the trend blocks used in the previous assessment(s) were compared against the 2015 assessment translation.

If a country determines that changes to the trend blocks are absolutely necessary (e.g., in order to correct a mistranslation discovered in a previous translation), the changes are carefully documented and reviewed. Items with changes may not be included in the trend analyses for that participant.

The preparation of the trend blocks for countries not participating in the trend comparison follows the same general procedure for preparation as the newly developed assessment blocks for the current cycle.

## Translation and Adaptation of the Questionnaires

The translation of the questionnaires differs from the assessment items in that participating countries are required to adapt some terms, and to ensure that questions are appropriate for the national context and education system. The terms requiring adaptation are listed in angle brackets in the international version with their country-specific information. For instance, <language of test> and <fourth grade> would be adapted to the name of the actual language and grade in which the assessment is being administered-for example, in Singapore, these terms would be replaced by equivalents "English" and "Primary 4". Some terms related to specific aspects of teaching and learning also are designated for adaptation-<in-service/professional development> should be adapted to the local term that denotes the supplemental training provided to teachers during their professional careers (e.g., in Lithuania this would be "qualification development"). Items assessing levels of education use the current version of the International Standard Classification of Education (ISCED) system, ISCED 2011 (UNESCO Institute for Statistics, 2012), and require adaptation to the nationally equivalent educational terms for each participating country.

The guidelines for translation and adaptation provide countries with detailed descriptions of the intent of each required adaptation to clarify the meaning of the terms used and to enable the translators to select the appropriate national term or expression to convey the intended meaning. For TIMSS 2015, the main difficulties encountered in adapting the questionnaires involved specific educational contexts, administration of the assessment at different grade levels than the internationally-defined target, and, for some countries, multiple languages of administration.

Countries are permitted to add a limited number of national interest questions to the questionnaires. To avoid influencing responses to the international questions, NRCs are advised to place any national interest questions at the end of the corresponding module or questionnaire, and to ensure these adopt the same format as the rest of the questionnaire. All national interest questions must be documented and approved by the TIMSS \& PIRLS International Study Center before inclusion in the questionnaires.

## The National Adaptation Forms

NRCs must prepare one National Adaptation Form (NAF) for each language and set of instruments. The NAF is an Excel document formatted to contain the complete translation, adaptation, and verification history of each set of national instruments. All national adaptations should be documented in the NAF. During various stages of the instrument preparation process, the form is completed and reviewed.

During the process of translation and adaptation for a set of national instruments, the first version of the NAF is filled out in collaboration with the translator(s), reviewer(s), and NRC. The translator and reviewer document the initial adaptations made to the instruments, which the NRC then reviews and consolidates. The NAF is updated and revised after each round of international verification, with comments from verifiers and the NRC.

Documenting an adaptation in the NAF requires recording the following information: identification of what is being adapted (location and/or question number), an English back translation of the adaptation, and recoding instructions (if applicable). For ease of use and documentation of the different stages of verification, the NAF includes designated areas for each item, respondent, and instrument.

The NAF is an important record of each country's final instruments, as it contains information used throughout the different stages of translation and verification. The International Quality Control Monitors also use the NAF after data collection to review the implementation of verification feedback (see Chapter 6: Survey Operations Procedures in TIMSS 2015 and Chapter 9: Quality Assurance for TIMSS 2015 in Methods and Procedures in TIMSS 2015). The NAF is referenced when adding national data to the international database and during data analysis.

## International Translation Verification

The national translations of the instruments are required to undergo international translation verification. The IEA Secretariat manages the international translation verification process in coordination with an external translation verification company, cApStAn Linguistic Quality Control (based in Brussels, Belgium).

## Translation Verifiers

For TIMSS, the international translation verifiers are responsible for reviewing and documenting the quality and comparability of the national instruments to the international instruments. The required qualifications for verifiers include:

- Fluency in English
- Mother tongue proficiency in the target language
- Formal credentials as translators working in English
- University-level education and (if possible) familiarity with the subject area
- Residency in the target country, or close contact with the country and its culture

The IEA Secretariat trains all international translation verifiers, and supplies verifiers with a comprehensive set of instructional materials to support their work. For TIMSS 2015, verifiers were trained through web-based seminars and were provided with information about TIMSS and the assessment instruments. Each verifier received a document containing the description of the adaptation and translation guidelines, the relevant manuals and instruments, and a document with the directions and instructions for reviewing the national instruments and registering deviations from the international version. During the verification of the final assessment instruments, verifiers were given a list of changes to the international instruments made after the field test and also were able to access the relevant national field test NAF.

## The Translation Verification Process

The instructions and training given to the verifiers emphasize the importance of maintaining the same meaning and difficulty level in the translations and adaptations as in the international versions, and ensuring that translations and adaptations are adequate and consistent within and across national instruments. The translation verification process involves:

- Checking the accuracy, linguistic correctness, and comparability of the translation and adaptations of the achievement items and questionnaires
- Documenting any deviations between the national and international versions, including additions, deletions, and mistranslations
- Suggesting an alternative translation/adaptation to improve the accuracy and comparability of the national instruments

Verifiers provided feedback from translation verification in both the set of instruments and the associated NAF. Verifiers were asked to correct the text of the assessment items and questionnaires and/or to add notes specifying errors using either "Sticky Notes" in Adobe PDFs or "Track Changes" and "New Comment" functions in Microsoft Word. During translation
verification, some of the typical errors identified by the verifiers included mistranslations, omissions/additions of text, inconsistent translations (mathematical symbols, adaptation of ISCED levels, literal versus synonymous matches), adaptations of names (fictional versus real), gender agreement, and grammar. Some of the domain-specific concepts in mathematics and science (e.g., "line of symmetry") were a particular challenge to translate for some languages. With the documented comments and suggestions from the verifiers, NRCs were able revise and improve their national versions.

All comments viewed by the verifiers as deviations in the adaptation/translation were entered into the NAF. All verifier comments were accompanied by a code to help NRCs understand the severity and type of deviation of the translated text with the international version. Any adaptations reported in the NAF must also be reviewed by the verifier and commented on for their adequacy.

## Codes Used in Verification Feedback

#### Abstract

To help establish the quality and comparability of the translated/adapted instruments, the international translation verifiers aim to provide meaningful feedback to the NRCs, TIMSS \& PIRLS International Study Center staff, and other members of the study consortium. To standardize the verification feedback across countries, verifiers are asked to assign a code to each intervention, indicating the nature and severity of the issue identified. These codes are accompanied by explanatory information, along with corrections or suggestions for improvement, if applicable. The criteria for coding are as follows:

CODE 1 indicates a major change or error. Examples include the omission or addition of a question or answer option; incorrect translation that changes the meaning or difficulty of the item or question; and incorrect order of questions or answer options in a multiple-choice question.

If in any doubt, verifiers are instructed to use CODE 1? so that the error can be referred to the TIMSS \& PIRLS International Study Center for further consultation.

CODE 2 indicates a minor change or error, such as a spelling or grammar error that does not affect comprehension.

CODE 3 indicates that while the translation is adequate, the verifier has a suggestion for an alternative wording.
CODE 4 indicates that an adaptation is acceptable and appropriate. For example, a reference to winter for a country in the Southern Hemisphere is changed from January to July.

## Verification of the Trend Assessment Blocks

For all countries assessing trends, the international verification procedure includes a 'trend check' for the achievement instruments to ensure that the trend items have not been changed. This involves:

- Checking that each of the trend items for the current cycle remain identical to the trend items as they were administered in the previous cycle
- Documenting any differences in content

The verifiers were instructed to record any discrepancies found in the trend items in the NAF. NRCs are instructed to carefully review all discrepancies and are instructed to discuss any proposed changes with the TIMSS \& PIRLS International Study Center.

## TIMSS 2015 Arabic International Source Version

As has been the practice since 2007, an Arabic version of the TIMSS 2015 instruments was made available to all Arabic-speaking countries to use as a starting point for their national assessment materials preparation. The international instruments that were translated into Arabic were the TIMSS Numeracy and the TIMSS 2015 fourth and eighth grade field test instruments (student achievement test and questionnaires for students, home, teachers, and school principals).

The initial translation of the TIMSS 2015 field test into Arabic was produced according to the guidelines for translation and the translation process design. The translation was produced by two teams of expert translators, from BranTra (an independent translation agency based in Brussels, Belgium). Each team consisted of a pair of translators and one reviewer. One team worked on the TIMSS Numeracy and the TIMSS 2015 fourth grade instruments, and the other team on the TIMSS 2015 eighth grade instruments. Every translator produced a separate translation that, upon completion, was compared and reviewed against the other translations, with only the best translations being selected by the reviewer for use in the field test instruments. The resulting draft source instruments underwent multiple review stages, with an emphasis on assessing the content and terminology used in specific school subjects at the target grades in a variety of Arabic-speaking countries.

Upon completion of the content review (also involving the most experienced NRCs from countries interested in using this source version), the materials were reviewed and reconciled based on the comments, suggestions and changes. The reconciled translation of the assessment materials was then sent to the TIMSS \& PIRLS International Study Center for production.

The same groups of translators and reviewers reviewed and updated the Arabic translation of the TIMSS assessment after the field test and prior to the TIMSS 2015 assessment data collection. To aid the translators and reviewer in updating the Arabic translation, the TIMSS \& PIRLS International Study Center provided a list of changes made to the international version after the field test.

The TIMSS \& PIRLS International Study Center used the World Tools Plugin to convert the production InDesign files to a right-to-left format for the Arabic achievement booklets and background questionnaires. The TIMSS \& PIRLS International Study Center imported the Arabic translation from rich-text format (RTF) documents into InDesign using the program CopyFlow Gold. After the translation was imported, the TIMSS \& PIRLS International Study Center applied fonts, styles, and graphics to the instruments and thoroughly reviewed the documentation to ensure that the translations and layout resembled the international English version. Before the release of TIMSS 2015 assessment in Arabic to participating countries, an additional optical check was performed to verify the layout of the Arabic version and eradicate any remaining errors or issues that occurred during the import process. The multiple stages of translation and review of the Arabic version ensured that the translation was an adequate starting point for interested countries to begin the adaption process for their country contexts.

## Outcomes and Summary for TIMSS 2015

To ensure high quality and international comparability of the national instruments prepared by participating countries, the 2015 cycle of TIMSS incorporated stringent procedures for translation and translation verification, similar to previous cycles. NRCs were provided with a comprehensive set of guidelines that contained information covering their responsibilities, from appointing highly skilled and experienced translators to ensuring the accuracy of the documentation of national adaptations recorded in the NAFs. After the initial completion of the national versions, countries were to perform an internal review that was followed by the international verification of the adaptations and translation performed by well-trained and experienced verifiers.

During the translation verification processes of the assessment, verifiers made comments and suggestions on errors, from typographical errors and inconsistent translations, to omissions/ additions of text and mistranslations. This important feedback aided the NRCs in revising and improving the quality of their national versions in line with the translation guidelines for TIMSS 2015. Additionally, during the verification of the assessment materials, verifiers commented on the great care taken by the NRCs in implementing the field test verification feedback, improving the quality of the translations. Overall the documentation of national adaptations in the NAFs and feedback from the results of the assessment translation verification indicated that the TIMSS 2015 national instruments were of very high quality.

The verification outcomes confirm that countries rigorously implemented the guidelines, documentation, and policies and procedures (including submission of materials and review of post-verification materials).

## CHAPTER 8

## Layout Verification for TIMSS 2015

Erin Wry<br>leva Johansone

Layout verification is the final external review and ratification of each participating country's national assessment instruments and their corresponding National Adaptations Forms. To ensure that the instruments are of the highest quality and are comparable across all of the participating countries and benchmarking entities, countries follow standard internationally agreed-upon procedures in preparing national versions of the assessment instruments (see Chapter 6 on Survey Operations Procedures). Assessment translation guidelines allow for national adaptations to instruments as long as international comparability is maintained. Countries are required to document any national adaptations applied to the international assessment instruments within the TIMSS 2015 National Adaptations Forms. This documentation is verified nationally and internationally throughout all stages of preparing each country's national instruments.

Prior to both the field test and main data collection, all national instruments undergo independent translation verification coordinated by the IEA Secretariat, and after the contents of the achievement booklets and context questionnaires have completed translation verification, the national instruments are sent to the TIMSS \& PIRLS International Study Center for layout verification. During the layout verification process, the TIMSS \& PIRLS International Study Center checks to ensure that all national assessment instruments conform to the international format and that any national adaptations made to the TIMSS 2015 international instruments do not unduly influence their international comparability. In particular, layout verification focuses on the following:

- Reviewing the national assessment instruments for acceptable layout structure including pagination, page breaks, item sequence, response options, text formats, and graphics
- Reviewing the national adaptations applied to both the international achievement booklets and context questionnaires with respect to how they may influence the international comparability of the data

## Scope of Layout Verification for TIMSS 2015

Participating countries and benchmarking entities prepare national versions of the instruments for the field test and then again for the main data collection. This includes translating and/or adapting the newly developed items and questionnaires in preparation for the field test. Then, changes resulting from the field test are applied to the achievement items selected for the main data collection and similar modifications are applied to the context questionnaires. Accordingly, in preparation for TIMSS 2015 assessment administration, layout verification was conducted twice for each participating country-once for the field test and again for the main data collection.

To complete layout verification, each country submits the following documentation for each language in which they are administering the assessment(s):

- A set of all achievement booklets assembled in complete, ready-to-print booklet form
- Context questionnaires for school principals, teachers, parents/guardians ${ }^{1}$, and students in complete, ready-to-print booklet form
- National Adaptations Forms for both the achievement booklets and context questionnaires, including documentation of national adaptations and the feedback received from translation verification

For the TIMSS 2015 main data collection, layout verification was completed for 57 countries and seven benchmarking participants. This included 48 countries and 7 benchmarking participants for the fourth grade assessment, 7 countries and 1 benchmarking participant for the TIMSS Numeracy assessment, and 40 countries and 7 benchmarking participants for the eighth grade assessment. With 22 countries administering the assessment(s) in multiple languages, the TIMSS \& PIRLS International Study Center reviewed a total of 140 sets of national TIMSS 2015 assessment instruments (each set including achievement booklets and context questionnaires). A list of assessment instruments and languages they were administered in each of the participating countries can be found in Exhibits 7.1-7.3 of the Translation and Translation Verification chapter of this volume.

## Layout Verification of Achievement Booklets

The primary goal of layout verification is to ensure that students in different countries experience the assessment instruments in the same way. Thus, the national achievement booklets were checked against the international versions to identify any deviations from the international format.

Due to differences in languages, the national assessment instruments varied slightly in length and format. The international versions, however, were designed with this in mind, and extra space was provided in the margins of the pages to facilitate the use of longer text and different paper sizes (letter versus A4) without necessitating extensive changes to the layout of each page.

[^5]National Research Coordinators (NRCs) were directed to document all national adaptations (apart from direct translations) made to the achievement booklets within the achievement booklet National Adaptations Forms. During layout verification, the verifiers also checked the achievement items for international comparability while taking into consideration the national adaptations documented by the NRCs. Any layout deviations or errors, as well as any concerns of international incomparability of assessment items, were documented by the verifiers in the National Adaptations Forms.

Per the TIMSS assessment design, the TIMSS 2015 achievement instruments include blocks of items from TIMSS 2011 and TIMSS 2007. These "trend blocks" provide the foundation for the measurement of change in student achievement over time and therefore must be administered in the same way across subsequent TIMSS cycles. As such, for countries that previously participated in TIMSS 2011 and/or TIMSS 2007, the TIMSS 2015 trend blocks were reviewed during the layout verification against those from the last cycle in which the country participated. Any deviations from the previous cycle were documented by the verifiers within the National Adaptations Forms.

Following layout verification, the National Adaptations Forms containing the verifiers' comments were sent back to the National Research Coordinators for consideration. The National Research Coordinators were asked to confirm that each of the suggested changes was implemented or provide an explanation for not implementing the suggested change.

## Layout Verification of Context Questionnaires

As with the achievement booklets, the context questionnaires were also checked against the international versions to identify any potential layout issues as well as to ensure the international comparability of the questionnaire data.

In an effort to make the questionnaires general enough for international analyses but appropriate for each intended audience, participating countries were required to adapt certain phrases and designations in the text of the questionnaires. The text that requires country-specific adaptations is enclosed in brackets (e.g., <fourth grade>) in the international instruments. To assist the NRCs in finding comparable and appropriate substitutions for the bracketed text, the TIMSS \& PIRLS International Study Center supplied documentation in one of the Survey Operations Units, providing explanations of the intended meaning of each bracketed text, and where applicable, offered examples to guide the National Research Coordinators in selecting appropriate replacements.

National Research Coordinators were directed to document all national adaptations made to the context questionnaires within the National Adaptations Forms. During the layout verification, the verifiers checked the instruments for international comparability, taking into consideration the national adaptations documented by the National Research Coordinators. Any internationally incomparable adaptations or errors were documented by the verifiers in the National Adaptations Forms along with recommendations for recoding or rewording.

Additionally, the verifiers ensured that all bracketed text, requiring country-specific adaptations, was properly documented with English back translations. The documentation for these universally adapted questionnaire items is intended for later use in the National Adaptations Database. The database is a compilation of each country's intended adaptations, to be used during data processing by the IEA Data Processing and Research Center, and the information included in the database is reported as a supplement to the user guide for the TIMSS 2015 International

## Database.

Similar to the layout verification process for the achievement items, layout verifiers provided the NRCs with feedback through the National Adaptations Forms, and the NRCs were asked to respond to the feedback by either confirming the implementation of the suggested modifications or providing an explanation as to why the changes were not applied.

## CHAPTER 9

## Quality Assurance Program for TIMSS 2015

leva Johansone
Erin Wry

Considerable effort has been made to develop standardized materials and survey operations procedures so that the TIMSS 2015 data meet the highest standards. To document data collection activities and verify that the standardized TIMSS procedures were followed, the TIMSS \& PIRLS International Study Center, working in coalition with the IEA Secretariat, developed and implemented an ambitious International Quality Assurance Program. The purpose of this chapter is to provide an overview of the International Quality Assurance Program and report on the data collected through the program.

## Overview

The International Quality Assurance Program was implemented by independent International Quality Control Monitors (IQCMs) appointed by the IEA Secretariat. The major task of the IQCMs was to conduct site visits during the data collection process. In each country, the IQCM visited a sample of 15 participating schools at each grade during the testing sessions. When there were one or more benchmarking participants from the same country, and only one centrally organized national center responsible for all aspects of data collection, five additional school visits were required for each benchmarking entity.

For each school visit, IQCMs observed the testing session and recorded their observations, noting any deviations from the standardized administration script, timing, and procedures. In addition, IQCMs interviewed the School Coordinators about their experiences coordinating the TIMSS 2015 assessment. IQCMs also checked whether the suggestions made by the international translation and layout verifiers had been integrated into the final assessment instruments, as documented in the National Adaptations Forms.

Prior to beginning their assignments, the IQCMs were mandated to attend a training session conducted by the TIMSS \& PIRLS International Study Center. There were two training sessions, one for Southern Hemisphere countries and one for Northern Hemisphere countries. During the training, IQCMs were introduced to the TIMSS survey operations procedures and the design of
the TIMSS 2015 achievement booklets and context questionnaires. IQCMs were also supplied with a manual detailing their role and responsibilities as well as the necessary materials for completing the quality control tasks.

An important aspect of the International Quality Assurance Program is the independence of the IQCMs from the national centers. In most participating countries and benchmarking entities, the IEA Secretariat recruited IQCMs who had served in the same role in previous IEA assessments. For the remaining countries, National Research Coordinators assisted the IEA Secretariat in nominating an International Quality Control Monitor (ICQM). The nominated person could not be a member of the national center, or a family member or personal friend of the NRC. Often, this person was a school inspector, ministry official, or retired school teacher. The IQCM was required to be fluent in both English and the language(s) spoken in the country.

When necessary, the IQCMs were permitted to recruit assistants in order to effectively cover the territory and testing timetable. For TIMSS 2015, a total of 64 IQCMs were trained across the 57 participating countries and 7 benchmarking participants. In addition, the IQCMs trained more than 250 assistant monitors. Altogether, Quality Control Monitors observed 768 fourth grade testing sessions, 108 Numeracy sessions, and 614 eighth grade sessions. The results of the TIMSS 2015 IQCM observations are reported in the following sections of this chapter.

## Quality Control Observations of the TIMSS 2015 Data Collection

International Quality Control Monitors (IQCMs) conducted site visits during TIMSS test administration to a sample of 15 schools per grade in each country. For each school visit, the IQCMs completed the TIMSS 2015 Classroom Observation Record. For purposes of reporting, the TIMSS Numeracy records were combined with the TIMSS fourth grade records.

The observation records were organized into four sections:

- Section A-Documentation of the TIMSS/TIMSS Numeracy Testing Session
- Section B-Summary Observations of the TIMSS/TIMSS Numeracy Testing Session
- Section C-Student Questionnaire Administration and Distribution of the Early Learning Survey
- Section D-Interview with the School Coordinator

## Documentation and Summary Observations of the TIMSS 2015 Testing Sessions

Sections A and B of the Classroom Observation Record addressed activities that took place during the actual testing sessions. The achievement test was administered in two parts with a break of up to 30 minutes between each part. During test administration, IQCMs were asked to observe the activities of the Test Administrator, specifically the following:

- Distributing, collecting, and securing the test booklets
- Following the assessment administration script
- Making time announcements during the testing sessions

Exhibits 9.1 and 9.2 show that IQCMs reported that the assessments were conducted in accordance with the international procedures, particularly, in regard to booklet distribution and adherence to time limits. In a few sessions ( $4 \%$ for Part 1 and 6\% for Part 2 at the fourth grade; $4 \%$ for Part 1 and 7\% for Part 2 at the eighth grade), the total testing time for either Part 1 or Part 2 was not equal to the time allowed. Usually, this was because students had completed their work a few minutes before the allotted time had elapsed. If Test Administrators observed students working faster than expected, a remaining-time announcement was made prior to the planned 10 minute warning to inform students that they still had ample time to complete their work.

Exhibit 9.1: Observations of TIMSS 2015 Fourth Grade and TIMSS Numeracy Assessment Administration Sessions-876 Sessions (Percent of IQCM Responses)

| Question | Yes (\%) | No (\%) | Not Answered (\%) |
| :---: | :---: | :---: | :---: |
| Did the Test Administrator distribute the test booklets according to the booklet assignment on the Student Tracking Form and booklet labels? | 99 | 1 | 0 |
| Did the total testing time for Part 1 equal the time allowed? | 96 | 4 | 0 |
| Did the Test Administrator announce "you have 10 minutes left" prior to the end of Part 1 ? | 93 | 7 | 0 |
| Were there any other time remaining announcements made during Part 1 ? | 24 | 76 | 0 |
| Was the total time for the break equal to or less than 30 minutes? | 95 | 5 | 0 |
| Were the booklets left unattended or unsecured during the break? | 4 | 96 | 0 |
| Did the total testing time for Part 2 equal the time allowed? | 94 | 6 | 0 |
| Did the Test Administrator announce "you have 10 minutes left" prior to the end of Part 2? | 92 | 8 | 0 |
| Were there any other time remaining announcements made during Part 2? | 19 | 81 | 0 |
| Did any students finish either Part 1 or Part 2 of the assessment early (before the 36 minutes were up)? | 85 | 15 | 0 |
| Did the test administrator have a watch with a seconds hand (or stopwatch) for accurately timing the testing session(s)? | 97 | 3 | 0 |
| Were the booklets collected and secured after the testing session? | 96 | 4 | 0 |

## Exhibit 9.2: Observations of TIMSS 2015 Eighth Grade Assessment Administration Sessions -614 Sessions (Percent of IQCM Responses)

| Question | Yes (\%) | No (\%) | Not <br> Answered (\%) |
| :---: | :---: | :---: | :---: |
| Did the Test Administrator distribute the test booklets according to the booklet assignment on the Student Tracking Form and booklet labels? | 99 | 1 | 0 |
| Did the total testing time for Part 1 equal the time allowed? | 96 | 4 | 0 |
| Did the Test Administrator announce "you have 10 minutes left" prior to the end of Part 1? | 93 | 7 | 0 |
| Were there any other time remaining announcements made during Part 1 ? | 20 | 80 | 0 |
| Was the total time for the break equal to or less than 30 minutes? | 95 | 3 | 2 |
| Were the booklets left unattended or unsecured during the break? | 1 | 99 | 0 |
| Did the total testing time for Part 2 equal the time allowed? | 95 | 5 | 0 |
| Did the Test Administrator announce "you have 10 minutes left" prior to the end of Part 2? | 93 | 7 | 0 |
| Were there any other time remaining announcements made during Part 2? | 19 | 81 | 0 |
| Did any students finish either Part 1 or Part 2 of the assessment early (before the 45 minutes were up)? | 77 | 23 | 0 |
| Did the test administrator have a watch with a seconds hand (or stopwatch) for accurately timing the testing session(s)? | 96 | 4 | 0 |
| Were the booklets collected and secured after the testing session? | 96 | 4 | 0 |

For both grades, $95 \%$ of all IQCM records reported that the break between Part 1 and Part 2 of the testing session did not exceed 30 minutes, and nearly all IQCMs reported that the testing materials were almost always secured or supervised during the break ( $96 \%$ at the fourth grade and $99 \%$ at the eighth grade). In accordance with the TIMSS procedure, at the end of the testing session, Test Administrators were asked to collect and secure the test booklets. The IQCMs reported that in $96 \%$ of the testing sessions for both grades this occurred. However, in a few cases, the Student Questionnaire was attached to the test booklet, and in these cases students retained their test booklets until they completed their questionnaire.

Exhibits 9.3 and 9.4 report on the activities conducted during the assessment sessions. One of the most important methods of standardizing the assessment administration was to have all test administrators follow the script in the Test Administrator Manual. IQCMs reported that in more than three-quarters of the observations at both grades, the Test Administrators exactly followed the script. In the circumstances in which the Test Administrator deviated from the script, nearly all modifications were reported as "minor."

Exhibit 9.3: Test Administrators Following the Test Administration Script-876 Fourth Grade and TIMSS Numeracy Sessions (Percent of IQCM Responses)

| Question | Yes (\%) | No (\%) | Not Answered (\%) |
| :---: | :---: | :---: | :---: |
| Had the test administrator familiarized himself or herself with the test administration script prior to the testing? | 94 | 4 | 2 (I Cannot Answer) <br> 0 (Not Answered) |
| Did the test administrator follow the test administration script in the Test Administrator Manual? | 77 | 21 (Minor changes) 2 (Major changes) | 0 |
| If the Test Administrator made changes to the script, how would you describe them? |  |  |  |
| Additions | 15 | 8 | 0 (Not Answered) <br> 77 (Not Applicable) |
| Revisions | 10 | 13 | 0 (Not Answered) <br> 77 (Not Applicable) |
| Deletions | 5 | 18 | 0 (Not Answered) <br> 77 (Not Applicable) |
| Did the test administrator address student questions appropriately? | 98 | 2 | 0 |

Exhibit 9.4: Test Administrators Following the Test Administration Script-614 Eighth Grade Sessions (Percent of IQCM Responses)

| Question | Yes (\%) | No (\%) | Not Answered (\%) |
| :---: | :---: | :---: | :---: |
| Had the test administrator familiarized himself or herself with the test administration script prior to the testing? | 92 | 4 | 2 (I Cannot Answer) <br> 0 (Not Answered) |
| Did the test administrator follow the test administration script in the Test Administrator Manual? | 80 | 18 (Minor changes) 2 (Major changes) | 0 |
| If the Test Administrator made changes to the script, how would you describe them? |  |  |  |
| Additions | 11 | 9 | 0 (Not Answered) <br> 80 (Not Applicable) |
| Revisions | 11 | 9 | 0 (Not Answered) <br> 80 (Not Applicable) |
| Deletions | 7 | 13 | 0 (Not Answered) <br> 80 (Not Applicable) |
| Did the test administrator address student questions appropriately? | 98 | 1 | 1 |

Exhibits 9.5 and 9.6 present observations on student compliance with instructions and overall cooperation during the assessment administration. According to the IQCMs' observations, in almost all of the sessions, students complied well or very well with the instruction to stop work at the end of both Part 1 and Part 2. In addition, IQCMs described the students as extremely orderly and cooperative during most of the testing sessions.

Exhibit 9.5: Student Cooperation During Assessment Administration-876 Fourth Grade and TIMSS Numeracy Sessions (Percent of IQCM Responses)

| Question | Very Well <br> (\%) | Fairly Well <br> (\%) | Not well <br> at all (\%) | Not <br> Answered (\%) |
| :--- | :---: | :---: | :---: | :---: | :---: |
| When the Test Administrator ended Part 1, <br> how well did the students comply with the <br> instruction to stop work? | 88 | 12 | 0 | 0 |
| When the Test Administrator ended Part 2, <br> how well did the students comply with the <br> instruction to stop work? | 89 | 10 | 1 |  |

Exhibit 9.6: Student Cooperation During Assessment Administration-614 Eighth Grade Sessions (Percent of IQCM Responses)

| Question | Very Well <br> (\%) | Fairly Well <br> (\%) | Not well <br> at all (\%) | Not <br> Answered (\%) |
| :--- | :---: | :---: | :---: | :---: | :---: |
| When the Test Administrator ended Part 1, <br> how well did the students comply with the <br> instruction to stop work? | 86 | 14 | 0 | 0 |
| When the Test Administrator ended Part 2, <br> how well did the students comply with the <br> instruction to stop work? | 86 | 13 | 1 |  |

Summary Observations of the TIMSS 2015 Testing Sessions
Exhibits 9.7 and 9.8 report on the IQCMs' general observations of TIMSS assessment administration. Overall, IQCMs reported that the quality of testing sessions was very good or excellent ( $90 \%$ at the fourth grade and $87 \%$ at the eighth grade). In most of the testing sessions that the IQCMs attended, no problems were observed and in only $1 \%$ of cases for both grades did a student refuse to take the test. In addition, nearly all of the observed testing sessions took place under favorable room conditions that were suitable for students to work without distraction ( $96 \%$ at the fourth grade and $95 \%$ at the eighth grade). In $17 \%$ of the observed fourth grade testing sessions and in $10 \%$ of the eighth grade testing sessions, a student left the room for an "emergency" (usually a bathroom visit) during the testing session. In such cases, Test Administrators were instructed to collect the students' test booklets and return them when the students reentered the testing session. However, in a small number of cases, the students had already completed the test and, thus, it was not necessary to give back the test booklets when the students returned.

## Exhibit 9.7: General Observations of the Testing Session-876 Fourth Grade and TIMSS Numeracy Sessions (Percent of IQCM Responses)

| Question |  |  | Yes (\%) | No (\%) | Not Ar | nswered (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Did the student identification information on the booklets correspond with the Student Tracking Form? |  |  | 98 | 2 |  | 0 |
| Were any defective test booklets detected and replaced? |  |  | 2 (BEFORE the testing began) 1 (AFTER the testing began) | 98 (BEFORE the testing began) 97 (AFTER the testing began) |  | EFORE the ing began) <br> AFTER the ing began) |
| If any defective test booklets were replaced, did the Test Administrator replace them appropriately? |  |  | 2 | 1 |  | t Answered) <br> t Applicable) |
| Did any students refuse to take the test? |  |  | 0 | 100 |  | 0 |
| If a student refused, did the Test Administrator accurately follow the instructions for excusing the student? |  |  | 0 | 0 | $\begin{array}{r} 0 \text { (No } \\ 100 \text { (N } \end{array}$ | t Answered) <br> ot Applicable) |
| Were any late students admitted to the testing room? |  |  | 4 (BEFORE the testing began) 2 (AFTER the testing began) | 92 (There were no late students) <br> 1 (Late students were not admitted) |  | 1 |
| Did any students leave the room for an "emergency" during the testing? |  |  | 17 | 83 |  | 0 |
| If a student left the room for an emergency during the testing, did the Test Administrator address the situation appropriately (collect the test booklet, and if re-admitted, return the test booklet)? |  |  | 15 | 2 |  | t Answered) <br> t Applicable) |
| Were there any students requiring special accommodations (e.g., students with visual or hearing impairment, Dyslexia)? |  |  | 14 | 86 |  | 0 |
| Did students store away everything, including all electronic devices, having only a pen or a pencil and the test booklet for the duration of the test administration? |  |  | 96 | 4 |  | 0 |
| During the testing sessions did the test administrator walk around the room to be sure students were working on the correct section of the test and/or behaving properly? |  |  | 94 | 6 |  | 0 |
| Were the conditions in the testing room suitable (lighting, temperature, noise, etc.) for the students to work without distractions? |  |  | 96 | 4 |  | 0 |
| Did the seating arrangement provide adequate space for students to work and not be distracted by each other? |  |  | 97 | 3 |  | 0 |
| Did you see any evidence of students attempting to cheat on the tests (e.g., by copying from a neighbor)? |  |  | 6 | 94 |  | 0 |
| Question | Excellent <br> (\%) | Very <br> Good (\%) | Good (\%) | Fair (\%) P | Poor (\%) | Not Answered (\%) |
| In general, how would you describe the overall quality of the testing session? | 58 | 32 | 8 | 2 | 0 | 0 |

## Exhibit 9.8: General Observations of the Testing Session-614 Eighth Grade Sessions (Percent of IQCM Responses)

| Question |  |  | Yes (\%) | No (\%) | Not Ar | swered (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Did the student identification information on the booklets correspond with the Student Tracking Form? |  |  | 98 | 2 |  | 0 |
| Were any defective test books detected and replaced? |  |  | 1 (BEFORE the testing began) 1 (AFTER the testing began) | 99 (BEFORE the testing began) 97 (AFTER the testing began) | $\begin{array}{r} 0(B \\ \text { test } \\ 2 \text { (AFT } \end{array}$ | EFORE the ing began) ER the testing began) |

| Did any students leave the room for an "emergency" during the testing? |  |  | 10 | 89 |  | 1 |
| If a student left the room for an emergency during the testing, did the Test Administrator address the situation appropriately (collect the test booklet, and if re-admitted, return the test booklet)? |  |  | 9 | 1 |  | Answered) <br> t Applicable) |
| Were there any students requiring special accommodations (e.g., students with visual or hearing impairment, Dyslexia)? |  |  | 6 | 94 |  | 0 |
| Did students store away everything, including all electronic devices, having only a pen or a pencil and the test booklet for the duration of the test administration? |  |  | 96 | 4 |  | 0 |
| During the testing sessions did the test administrator walk around the room to be sure students were working on the correct section of the test and/or behaving properly? |  |  | 96 | 4 |  | 0 |
| Were the conditions in the testing room suitable (lighting, temperature, noise, etc.) for the students to work without distractions? |  |  | 95 | 5 |  | 0 |
| Did the seating arrangement provide adequate space for students to work and not be distracted by each other? |  |  | 96 | 4 |  | 0 |
| Did you see any evidence of students attempting to cheat on the tests (e.g., by copying from a neighbor)? |  |  | 6 | 94 |  | 0 |
| Question | Excellent (\%) | Very Good (\%) | Good (\%) | Fair (\%) P | Poor (\%) | Not Answered (\%) |
| In general, how would you describe the overall quality of the testing session? | 51 | 36 | 10 | 2 | 1 | 0 |

## Student Questionnaire Administration

Exhibits 9.9 and 9.10 summarize the IQCMs' observations of the Student Questionnaire administration. IQCMs reported that the Student Questionnaires were distributed according to the Student Tracking Forms and questionnaire labels. In most cases (75\% at the fourth grade and 80\% at the eighth grade), Test Administrators followed the Student Questionnaire administration script exactly. If the Test Administrator deviated from the script, most frequently the modifications were "minor." In $37 \%$ of all the fourth grade sessions, Test Administrators read Student Questionnaire questions aloud (this was not an option for the eighth grade sessions), while in $54 \%$ of the sessions, students answered these questions independently. It should be noted that some schools chose to administer the questionnaire on a different date than the TIMSS achievement booklets, and in these cases, IQCMs were not required to observe student questionnaire administration.

Exhibit 9.9: Student Questionnaire Administration-876 Fourth Grade and TIMSS Numeracy Sessions (Percent of IQCM Responses)

| Question | Yes (\%) | No (\%) | Not Answered (\%) |

## Interview with the School Coordinator

Section D was the final component of the Classroom Observation Record and involved the IQCM conducting an interview with the School Coordinator. The interview addressed issues such as the following:

- Shipment of assessment materials
- Arrangements for test administration
- Responsiveness of the national center to queries
- Necessity for make-up sessions
- Organization of classes in the school (to validate within-school sampling procedure)

As shown in Exhibits 9.11 and 9.12, a large majority of School Coordinators considered that the TIMSS 2015 administration in their school went very well overall ( $92 \%$ at the fourth grade and $89 \%$ at the eighth grade), that the School Coordinator Manual provided worked well ( $92 \%$ at the fourth grade and $93 \%$ at the eighth grade), and that other school staff members had mostly positive attitudes toward TIMSS testing ( $80 \%$ at the fourth grade and $81 \%$ eighth grade).

Exhibit 9.11: Interview with the School Coordinator, Overview-Fourth Grade and TIMSS Numeracy (Percent of School Coordinator Responses)

| Question | Very well, <br> no problems <br> (\%) | Satisfactorily, <br> few problems <br> $(\%)$ | Unsatisfactorily, <br> many problems <br> (\%) |
| :--- | :---: | :---: | :---: | :---: |

| (\%) | | Needs |
| :---: |
| improvement |
| (\%) |$\quad$| Not |
| :---: |
| Answered (\%) |

Exhibits 9.13 and 9.14 show that there were only a small number of cases where components were missing from the shipments of test materials. In some cases where the School Coordinator reported not receiving all of the TIMSS materials, test materials were brought to the school on the testing day by external Test Administrators.

## Exhibit 9.13: Interview with the School Coordinator, Details—Fourth Grade and TIMSS Numeracy (Percent of School Coordinator Responses)

| Question | Yes (\%) | No (\%) | Not Answered (\%) |
| :---: | :---: | :---: | :---: |
| Prior to the testing day, did you have time to check your shipment of materials from the national center? | 78 | 18 | 4 |
| Did you receive the correct shipment of the materials as listed in your School Coordinator Manual and according to the tracking forms? | 88 | 8 | 4 |
| If no, did the national center provide the missing materials in time for the testing? | 4 | 5 | 0 (Not Answered) <br> 91 (Not Applicable) |
| Was the national center responsive to your questions or concerns? | 93 | 4 | 3 |
| Was the Teacher Questionnaire administered online? | 25 | 71 | 4 |
| If the Teacher Questionnaire was administered online, did the teacher(s) encounter any problems? | 3 | 22 | 0 (Not Answered) <br> 75 (Not Applicable) |
| Was the School Questionnaire administered online? | 25 | 71 | 4 |
| If the School Questionnaire was administered online, did the person completing it encounter any problems? | 2 | 23 | 0 (Not Answered) <br> 75 (Not Applicable) |
| Was the Early Learning Survey administered online? | 9 | 80 | 11 |
| If the Early Learning Survey was administered online, did the parents/guardians encounter any problems? | 0 | 9 | 1 (Not Answered) 90 (Not Applicable) |
| Do you anticipate that a makeup session will be required at your school? | 8 | 92 | 0 |
| If yes, do you intend to conduct one? | 8 | 0 | 2 (Not Answered) <br> 90 (Not Applicable) |
| Did the students receive any special instructions, motivational talk, or incentives to prepare them for the assessment? | 61 | 39 | 0 |
| Is this a complete list of the classes in this grade in this school? | 90 | 8 | 2 |
| To the best of your knowledge, are there any students in this grade level who are not in any of these classes? | 3 | 95 | 2 |
| To the best of your knowledge, are there any students in this grade level in more than one of these classes? | 1 | 97 | 2 |
| If there was another international assessment, would you be willing to serve as a School Coordinator? | 91 | 9 | 0 |

## Exhibit 9.14: Interview with the School Coordinator, Details—Eighth Grade (Percent of School Coordinator Responses)

| Question | Yes (\%) | No (\%) | Not Answered (\%) |
| :---: | :---: | :---: | :---: |
| Prior to the testing day, did you have time to check your shipment of materials from the national center? | 76 | 23 | 1 |
| Did you receive the correct shipment of the materials as listed in your School Coordinator Manual and according to the tracking forms? | 84 | 13 | 3 |
| If no, did the national center provide the missing materials in time for the testing? | 4 | 8 | 4 (Not Answered) <br> 84 (Not Applicable) |
| Was the national center responsive to your questions or concerns? | 95 | 4 | 1 |
| Was the Teacher Questionnaire administered online? | 31 | 64 | 5 |
| If the Teacher Questionnaire was administered online, did the teacher(s) encounter any problems? | 5 | 26 | 5 (Not Answered) <br> 64 (Not Applicable) |
| Was the School Questionnaire administered online? | 30 | 65 | 5 |
| If the School Questionnaire was administered online, did the person completing it encounter any problems? | 1 | 28 | 6 (Not Answered) <br> 65 (Not Applicable) |
| Do you anticipate that a makeup session will be required at your school? | 15 | 85 | 0 |
| If yes, do you intend to conduct one? | 14 | 1 | 0 (Not Answered) 85 (Not Applicable) |
| Did the students receive any special instructions, motivational talk, or incentives to prepare them for the assessment? | 65 | 35 | 0 |
| Is this a complete list of the classes in this grade in this school? | 89 | 9 | 2 |
| To the best of your knowledge, are there any students in this grade level who are not in any of these classes? | 6 | 93 | 1 |
| To the best of your knowledge, are there any students in this grade level in more than one of these classes? | 2 | 96 | 2 |
| If there was another international assessment, would you be willing to serve as a School Coordinator? | 91 | 9 | 0 |

In more than half of the cases ( $61 \%$ at the fourth grade and $65 \%$ at the eighth grade), School Coordinators indicated that students were given special instructions, motivational talks, or incentives by a school official or the classroom teacher prior to testing. Eight percent of School Coordinators at the fourth grade and $15 \%$ of School Coordinators at the eighth grade anticipated needing a makeup session, and almost all of these coordinators intended to conduct one.

Because the sampling of classes requires a complete list of all classes in the school at the target grade, IQCMs were also asked to verify that the class list did indeed include all classes. Most School Coordinators confirmed that the complete list of classes had been documented and that all students appeared in one and only one of these classes.

As a reflection of the successful planning and implementation of TIMSS 2015, 91\% of respondents for both grades said that they would be willing to serve as a School Coordinator in future international assessments. Finally, it is notable that the response rate for the Classroom Observation Records was considerably high on all questions, with only a handful of questions going unanswered.

## CHAPTER 10

## Creating the TIMSS 2015 International Database

Sebastian Meyer
Mark Cockle
Milena Taneva

This chapter describes the procedures implemented by the IEA Data Processing and Research Center (IEA DPC) for checking the TIMSS 2015 data and creating the TIMSS 2015 International Database (IDB).

Preparing the TIMSS 2015 International Database (IDB) and ensuring its integrity was a complex endeavor requiring extensive collaboration between the IEA Data Processing and Research Center, the TIMSS \& PIRLS International Study Center, Statistics Canada, and the national centers of participating countries. Once the countries had created their data files and submitted them to the IEA DPC, an exhaustive process of checking and editing known as "data cleaning" began.

Data cleaning is the process of checking data for inconsistencies and formatting the data to create a standardized output. The overriding concerns of the data cleaning process were to ensure:

- All information in the database conformed to the internationally defined data structure
- The content of all codebooks and documentation appropriately reflected national adaptations to questionnaires
- All variables used for international comparisons were in fact comparable across countries (after harmonization, where necessary)
- All institutions involved in this process applied quality control measures throughout in order to assure the quality and accuracy of the TIMSS 2015 data

The IEA DPC was responsible for checking the data files from each country, applying standardized data cleaning rules to verify the accuracy and consistency of the data and documenting any deviations from the international file structure. Data files were created at each country's national center and reviewed prior to submission to the IEA DPC. The National Research Coordinators (NRCs) collaborated with the IEA DPC to resolve any queries which emerged during the data cleaning process, and the NRCs checked interim versions of the national/benchmarking participant database(s) produced by the IEA DPC. The TIMSS \& PIRLS International Study Center
provided the NRCs with univariate data almanacs containing summary statistics on each variable so that the national centers could evaluate their data from an international perspective.

The TIMSS \& PIRLS International Study Center also scaled the achievement and background data, as documented in Chapter 13: Scaling the TIMSS 2015 Achievement Data, and produced achievement scores (plausible values) and scores on the background scales. Using the WithinSchool Sampling Software (WinW3S) ${ }^{1}$ database and response data provided by the IEA DPC, Statistics Canada in collaboration with the IEA DPC calculated the sampling weights, population coverage, and school and student participation rates-as documented in Chapter 3 and Chapter 5.

## Data Sources

## Data Entry and Verification of Paper Questionnaires

Each national center was responsible for inputting the information collected in test booklets and paper-based questionnaires into computer data files using the IEA Data Management Expert (DME) software. The DME is a software system developed by the IEA DPC that facilitates data entry and includes validation checks to identify inconsistencies. As a general rule of thumb, national centers were instructed to enter data for any questionnaire that contained at least one valid response, discarding unused or empty questionnaires.

National centers entered responses from the paper instruments into data files using a predefined international codebook. The codebook contained information about the names, lengths, labels, valid ranges for continuous measures or counts or valid values for nominal or ordinal questions, and missing codes for each variable.

As documented in Chapter 7: Translation and Translation Verification, countries participating in TIMSS are expected to make national adaptations to certain questions in the international questionnaires (e.g., the questions about parents' education must be adapted to the national context). Countries making such adaptations were required to adapt the codebook structure to reflect the adaptations made to the national questionnaire versions before beginning the data entry process.

To ensure consistency across participating countries, the basic rule for data entry in the DME required national staff to enter data "as is" without any interpretation, correction, truncation, imputation, or cleaning.

The rules for data entry included the following:

- Responses to closed response items coded as " 1 " if the first option was used, " 2 " if the second option is marked, and so on
- Responses to open response questions, for example number of students in the TIMSS class, entered "as is" even if the value is outside the originally expected range

WinW3S is a software developed by the IEA DPC that stores participation information at school, teacher, class, and student levels in a relational database while maintaining a hierarchical ID system. The software allows users to perform all necessary within-school sampling according to the TIMSS standards, and also provides some data validation in and across these levels.

- Responses to filter questions and filter-dependent questions entered exactly as filled in by the respondent, even if the information provided is logically inconsistent
- Non-response, ambiguous responses, responses given outside of the expected format, or conflicting responses (e.g., selection of two options in a multiple-choice question), coded as "omitted or invalid"

As each respondent ID number was entered it was checked by the DME software for alignment with a five-digit checksum generated by WinW3S. A mistype in either the ID or the checksum resulted in an error message prompting the data-entry person to check the entered values. The data-verification module of DME also checked for a range of other issues such as inconsistencies in identification codes and out-of-range or otherwise invalid codes. When such issues were flagged by the software, the individuals entering the data were prompted to resolve the inconsistency or confirm that an issue existed before resuming data entry.

## Double-Data Entry

To check data entry reliability in participating countries, national centers were required to enter a $5 \%$ sample of each survey instrument (achievement booklet or questionnaire) twice by two different data entry persons (punchers). The IEA DPC recommended that countries begin the doubledata entry process as early as possible during the data capture period in order to identify possible systematic misunderstandings or mishandlings of data-entry rules and to initiate appropriate remedial actions-for example, retraining national center staff. Those entering the data were required to resolve discrepancies between the first and second data entries by consulting the original questionnaire and applying the international rules in a uniform way.

While it was desirable that each and every discrepancy be resolved before submission of the complete dataset, the acceptable level of disagreement between the originally entered and doubleentered data was established at 1 percent or less for questionnaire data and at the 0.1 percent or less level for achievement data. Values above this level required a complete re-entry of data.

The level of disagreement between the originally entered and double-entered data was evaluated by the IEA DPC, and it was found that in general the margin of error observed for processed data was well below the required threshold.

## Data Verification at the National Centers

Before sending the data to the IEA DPC for further processing, national centers carried out mandatory validation and verification steps on all entered data and undertook corrections as necessary.

While the questionnaire data were being entered, the data manager or other staff at each national center used the information from the Teacher Tracking Forms to verify the completeness of the materials. Student participation information (e.g., whether a student participated in the assessment or was absent) was entered via WinW3S.

The validation process was supported by an option in WinW3S to generate an inconsistency report. This report listed all of the types of discrepancies between variables recorded during the within-school sampling and test administration process and made it possible to cross-check these data against data entered in the DME, the database for online respondents, and the uploaded student data on the central international server.

Data managers were requested to resolve such issues before final data submission to the IEA DPC. If inconsistencies remained or the national center could not solve them, the DPC asked the center to provide documentation on these problems.

As well as submitting the validated data to the IEA DPC, NRCs also provided extensive documentation. In addition to documentation on inconsistencies, national centers submitted hard copies or electronic scans of all original student and Teacher Tracking Forms, Student-Teacher Linkage Forms, and when applicable a report on data-capture activities collected as part of the online Survey Activities Questionnaire.

## Data from Online Questionnaire Administration

As documented in Chapter 6: Survey Operations Procedures, national centers had the option of administering the principal, teacher, and home questionnaires online instead of, or in addition to, using paper-based questionnaires.

To ensure confidentiality, national centers provided every respondent with a letter that contained individual login information along with information on how to access the online questionnaire. This login information corresponded to the ID and checksum provided from WinW3S, meaning that the identity validation step occurring at the national centers for paperbased questionnaires occurred when the respondents' logged-in to the survey. Also, since responses were collected in digital format and stored directly on the IEA DPC server, there was no need for data entry, reducing the workload for national centers.

As a further advantage of online administration, the data tended to have less inconsistencies when compared with the data collected through the paper-based questionnaires, mitigating the number of issues needed to be resolved by the IEA DPC and the national centers. This is partly because, to some extent, the online system does not allow inconsistent response patterns. For example, if the directions ask the respondent to "Check one circle for each line," the system does not allow the respondent to check more than one response category on each line.

The TIMSS 2015 online questionnaires also include skip logic, which minimized response burden and improved data consistency. The TIMSS questionnaires have a number of questions that filter out respondents-meaning the subsequent questions are not applicable given the response to the filter question. For example, question 12 of the eighth grade school questionnaire reads "Does your school have a school library? If yes, go to 12 a , and if no, go to 13 ." If a respondent chooses "No," the online survey skips directly to Question 13, omitting Questions 12a and 12b. Not only does the skip logic save the respondents' time, it also results in fewer inconsistencies in the data received by the IEA DPC.

## Cleaning the International and National Databases

## Overview

In order to ensure the integrity of the international database, a uniform data cleaning process was followed, involving regular consultation between the IEA Data Processing and Research Center and the NRCs. After each country had submitted its data, codebooks, and documentation, the DPC, in collaboration with the NRCs, conducted a four-step cleaning procedure upon the submitted data and documentation:

1. A structural check
2. A check of the identification (ID) variables
3. Linkage cleaning
4. Background cleaning

The cleaning process was an iterative process. Numerous iterations of the four-step cleaning procedure were completed on each national data set. This repetition ensured that all data were properly cleaned and that any new errors that could have been introduced during the data cleaning were rectified. The cleaning process was repeated as many times as necessary until all data were made consistent and comparable. Any inconsistencies detected during the cleaning process were resolved in collaboration with national centers, and all corrections made during the cleaning process were documented in a cleaning report, produced for each country.

After the final cleaning iteration, each country's data were sent to Statistics Canada for the calculation of sampling weights, and then the data, including sampling weights, were sent to the TIMSS \& PIRLS International Study Center so that scaling could be performed. The NRCs were provided with interim data products to review at two different points in the process.

## Preparing National Data Files for Analysis

The main objectives of the data cleaning process were to ensure that the data adhered to international formats, that school, teacher, and student information could be linked across different survey files, and that the data reflected the information collected within each country in an accurate and consistent manner.

As illustrated in Exhibit 10.1, the program-based data cleaning consisted of a set of activities explained in the following subsections. The IEA DPC carried out all of these activities in close communication with the national centers.

Exhibit 10.1: Overview of Data Processing at the IEA Data Processing and Research Center

## Checking Documentation, Import, and Structure

For each country, data cleaning began with an exploratory review of its data-file structures and its data documentation, including a review of National Adaptation Forms, Student Tracking Forms, Teacher Tracking Forms, Student-Teacher Linkage Forms, and the Survey Activities Questionnaire.

The IEA DPC first merged the tracking information and sampling information captured in the WinW3S database with the student-level database containing the corresponding student survey instrument data. During this step, IEA DPC staff also merged the data from the school and teacher questionnaires for both the online and paper modes of administration. At this stage, data from the different sources was transformed and imported into one structured query language (SQL) database so that this information would be available during all further data-processing stages.

The first checks identified differences between the international and the national file structures. Some countries made adaptations (such as adding national variables or omitting or modifying international variables) to their questionnaires. The extent and nature of such changes differed across countries: some countries administered the questionnaires without any modifications (apart from translations and necessary adaptations relating to cultural or languagespecific terms), whereas other countries inserted response categories within existing international variables or added national variables.

To keep track of adaptations, staff at the TIMSS \& PIRLS International Study Center asked the national centers to complete National Adaptation Forms while they were translating the international version of the survey instruments. Where necessary, the IEA DPC modified the structure and values of the national data files to ensure that the resulting data remained comparable
across countries. Details about country-specific adaptations to the international instruments can be found in Supplement 2 of the TIMSS 2015 User Guide for the International Database.

The IEA DPC then discarded variables created purely for verification purposes during data entry, and made provision for adding new variables necessary for analysis and reporting, including reporting variables, derived variables, sampling weights, and scale scores.

Once IEA DPC staff had ensured that each data file matched the international format, they applied a series of standard data cleaning rules for further processing. Processing during this step employed software developed by the IEA DPC that could identify and correct inconsistencies in the data. Each potential problem flagged at this stage was identified by a unique problem number, and then described and recorded in a database. The action taken by the cleaning program or IEA DPC staff with respect to each problem was also recorded.

The IEA DPC referred problems that could not be rectified automatically through the program to the responsible NRC so that national center staff could check the original data-collection instruments and tracking forms to trace the source of these errors. Wherever possible, staff at the IEA DPC suggested a remedy and asked the national centers to either accept it or propose an alternative. If a national center could not solve issue through verification of the instruments or forms, the IEA DPC applied a general cleaning rule to the files to rectify the error. When all automatic updates had been applied, IEA DPC staff used SQL recoding scripts to directly apply any remaining corrections to the data files.

## Cleaning Identification Variables

Each record in a data file needs to have a unique identification number. The existence of records with duplicate ID numbers in a file implies an error of some kind. Some countries administered the school, teacher, and home questionnaire (fourth grade only) online in addition to the paper mode. This could yield the theoretical possibility that a respondent completed both the paper and the online versions of the questionnaire. If two records in a TIMSS 2015 database shared the same ID number and contained exactly the same data, the IEA DPC deleted one of the records and kept the other one in the database. In the rare case that both records contained different data and IEA DPC staff found it impossible to identify which record contained the "true data," national centers were asked which record to keep.

Although the ID cleaning covered all data from all instruments, it focused mainly on the student file. In addition to checking the unique student ID number, it was crucial to check variables pertaining to student participation and exclusion status, as well as students' dates of birth and dates of testing in order to calculate student age at the time of testing. The Student Tracking Forms provided an important tool for resolving anomalies in the database.

As mentioned previously, the IEA DPC conducted all cleaning procedures in close cooperation with the national centers. After national center staff had cleaned the identification variables, they passed the clean databases with information about student participation and exclusion on to

Statistics Canada, which used this information to calculate students' participation rates, exclusion rates, and student sampling weights.

## Checking Linkages

As data on students, parents, teachers, and schools appeared in a number of different data files, a process of linkage cleaning was implemented to ensure that the data files would correctly link together. The linking of the data files followed a hierarchical system of identification codes that included school, class, and student components. These codes linked the students with their class and/or school membership. Further information on linkage codes can be found in Chapter 6: Survey Operations Procedures.

Linkage cleaning consisted of a number of checks to verify that student entries matched between achievement files, student background files, scoring reliability files, and home background files. In addition, at this stage, checks were conducted to ensure that teacher and student records linked correctly with their corresponding schools. The Student Tracking Forms, Teacher Tracking Forms, and Student-Teacher Linkage Forms were crucial in resolving any anomalies. The IEA DPC also liaised with NRCs about any problematic cases, and the national centers were provided with standardized reports listing all inconsistencies identified within the data.

## Resolving Inconsistencies in Questionnaire Data

The amount of inconsistent and implausible responses in questionnaire data files varied considerably across countries. The IEA DPC determined the treatment of inconsistent responses on a question-by-question basis, using all available documentation to make an informed decision. IEA DPC staff also checked all questionnaire data for consistency across the responses given. For example, Question 1 in the school questionnaire asked for the total school enrollment in all grades, while Question 2 asked for the enrollment in the target grade only. Logically, the number given as a response to Question 2 could not exceed the number provided by school principals in Question 1. Similarly, it is not possible that the amount of years a teacher has been teaching altogether (Question 1 in the teacher questionnaires) exceeds his/her age (Question 3 in the teacher questionnaires). The IEA DPC flagged inconsistencies of this kind and then asked the national centers to review these issues. IEA DPC staff recoded as "invalid" those cases that could not be corrected.

Filter questions, which appeared in some questionnaires, directed respondents to a particular subquestion. The IEA DPC applied the following cleaning rule to these filter questions and the dependent questions that followed: If a respondent answered "No" to Question 13 in the school questionnaire "Does your school have a school library?" IEA DPC recoded any responses to the dependent questions as "logically not applicable." Also, following the same example, if the filter question was omitted but at least one valid response was found in the dependent questions then the IEA DPC recoded the filter question to "Yes." This of course is only possible for dichotomous filter questions (e.g., with response options such "Yes/No").

The IEA DPC also applied what are known as split variable checks to questions where the answer was coded into several variables. For example, Question 6 in the student questionnaire asked students: "Do you have any of these things at your home?" Student responses were captured in a set of eleven variables, each one coded as "Yes" if the corresponding "Yes" option was filled in and "No" if the "No" option was filled in. Occasionally, students checked the "Yes" boxes but left the "No" boxes unchecked. Because, in these cases, it was clear that the unchecked boxes actually meant "No," these responses were recoded accordingly.

## Resolving Inconsistencies Between Tracking Information and Questionnaire Data

Two different sets of TIMSS 2015 data indicated age and gender for students. The first set was the tracking information provided by the school coordinator or test administrator throughout the within-school sampling and test/questionnaire administration process. The second set comprised the actual responses given by students in the student questionnaires. In some cases, data across these two sets did not match and resolution was needed.

If the information on gender or birth year and month was missing in the student questionnaire but the student participated, this information, when available, was copied over from the tracking data to the questionnaire. If discrepancies were found between existing tracking and questionnaire gender and age data, the IEA DPC queried the case with the national center, and the national center investigated which source of information was correct.

## Handling of Missing Data

Two types of entries were possible during the TIMSS 2015 data capture: valid data values and missing data values. Missing data can be assigned a value of omitted/invalid, or not administered during data capture. The IEA DPC applied additional missing codes to the data to facilitate further analyses. This process led to four distinct types of missing data in the international database:

- Omitted or invalid: The respondent had a chance to answer the question but did not do so, leaving the corresponding item or question blank. This code was also used if the response was uninterpretable or out-of-range.
- Not administered: This signified that the item or question was not administered to the respondent, which meant that the respondent could not read and answer the question. The not administered missing code was used for those student test items that were not in the set of assessment blocks administered to a student either deliberately (due to the rotation of assessment blocks) or, in a very few cases, due to technical failure or incorrect translations. This missing code was also used for those records that were included in the international database but did not contain a single response to one of the assigned questionnaires. This situation applied to students who participated in the student test but the parent/guardian did not answer the home questionnaire.

In addition, the not administered code was used for individual questionnaire items that a national center decided not to include in the country-specific version of the questionnaire.

- Logically not applicable: The respondent answered a preceding filter question in a way that made the following dependent questions not relevant to him or her.
- Not reached: This applied only to the individual items of the student achievement test and indicated those items that students did not attempt due to a lack of time. "Not reached" codes were derived as follows: First, the last answer given by a student in a session is identified. This could be either a valid or invalid response to an item. The first omitted response after this last answer is coded as "omitted," but all following responses to these items in the session are then coded as "not reached." For example, the response pattern "1942999999" (where " 9 " represents "omitted") is recoded to "19429RRRRR" (where "R" represents "not reached").

## Data Cleaning Quality Control

Because TIMSS 2015 was a large and highly complex study with very high standards for data quality, maintaining these standards required an extensive set of interrelated data checking and data cleaning procedures. To ensure that all procedures were conducted in the correct sequence, that no special requirements were overlooked, and that the cleaning process was implemented independently of the persons in charge, the data quality control process included the following steps:

- Thorough testing of all data cleaning programs: Before applying the programs to real datasets, the IEA DPC applied them to simulation datasets containing all possible problems and inconsistencies
- Registering all incoming data and documents in a specific database: The IEA DPC recorded the date of arrival as well as specific issues requiring attention
- Carrying out data cleaning according to strict rules: Deviations from the cleaning sequence were not possible, and the scope for involuntary changes to the cleaning procedures was minimal
- Documenting all systematic data recodings that applied to all countries: The IEA DPC recorded all changes to data in the comprehensive cleaning documentation provided to national centers
- Logging every "manual" correction to a country's data files in a recoding script: Logging these changes, which occurred only occasionally, allowed IEA DPC staff to undo changes or to redo the whole manual-cleaning process at any later stage of the data cleaning process
- Repeating, on completion of data cleaning for a country, all cleaning steps from the beginning: This step allowed the IEA DPC to detect any problems that might have been inadvertently introduced during the data cleaning process
- Working closely with national centers at various steps of the cleaning process: The IEA DPC provided national centers with the processed data files and accompanying documentation so that center staff could thoroughly review and correct any identified inconsistencies

The IEA DPC compared national adaptations recorded in the documentation for the national datasets with the structure of the submitted national data files. IEA DPC staff then recorded any identified deviations from the international data structure in the national adaptation database and for the supplementary materials provided with the TIMSS 2015 User Guide for the International Database. Whenever possible, the IEA DPC recoded national deviations to ensure consistency with the international data structure.

## Interim Data Products

Before the TIMSS International Databases were finalized, two major interim versions of the data files were sent to each country-each country receiving only its own data. The first version was sent as soon as the data could be considered "clean" as regards identification codes and linkage issues. Documentation, with a list of the cleaning checks and corrections made in the data, was included to enable the NRC to review the cleaning process before the $7^{\text {th }}$ NRC meeting in Lisbon in December 2015. A second version of the data files was sent to countries when the weights and international achievement scores were available and had been merged with the data files. This version, containing only records that satisfied the sampling standards, allowed the NRCs to replicate the results presented in the international reports.

Interim data products were accompanied by detailed data processing and national adaptation documentation, codebooks, and summary statistics. The summary statistics, preliminary versions of the TIMSS 2015 Almanacs, were created by the TIMSS \& PIRLS International Study Center and included weighted univariate statistics for all questionnaire variables for each country. For categorical variables, representing the majority of variables, the percentages of respondents choosing each of the response options were displayed. For continuous numeric variables, various descriptive statistics were reported, including the minimum, maximum, mean, standard deviation, median, mode, and percentiles. For both types of variables, the percentages of missing data were reported. Additionally, for the achievement items, the TIMSS \& PIRLS International Study Center provided item analysis and reliability statistics listing information regarding the number of valid cases, percentages, percentage correct, Rasch item difficulty, scoring reliability, and so forth. These statistics were used for a more in-depth review of the data at the international and national levels in terms of plausibility, unexpected response patterns, etc.

## Final Product-the TIMSS 2015 International Databases

The data cleaning effort implemented at the IEA DPC ensured that the TIMSS 2015 international databases contained high-quality data. More specifically, the process ensured that:

- Information coded in each variable was internationally comparable
- National adaptations were reflected appropriately in all variables
- All entries in the database could be successfully linked within and across levels
- Sampling weights and student achievement scores were available for international comparisons

Supplements to the TIMSS 2015 International Database and User Guide document all national adaptations made to questionnaires by individual countries and how they were handled in the data. The meaning of country-specific items also can be found in this supplement, as well as recoding requirements by the TIMSS \& PIRLS International Study Center.

## CHAPTER 11

## Reviewing the TIMSS 2015 Achievement Item Statistics

Pierre Foy
Michael O. Martin Ina V.S. Mullis

Liqun Yin
Victoria A.S. Centurino
Katherine A. Reynolds

The TIMSS \& PIRLS International Study Center conducted a review of a range of diagnostic statistics to examine and evaluate the psychometric characteristics of each achievement item across the countries that participated in the TIMSS 2015 assessments. This review of item statistics is essential to the successful application of item response theory (IRT) scaling to derive student achievement scores for analysis and reporting. This review played a crucial role in the quality assurance of the TIMSS 2015 achievement data prior to scaling, making it possible to detect unusual item properties that could signal a problem or error for a particular country. For example, an item that was uncharacteristically easy or difficult, or had an unusually low discriminating power, could indicate a potential problem with either translation or printing. Similarly, a constructed response item with unusually low scoring reliability could indicate a problem with a scoring guide in a particular country. In the rare instances where such items were found, the country's translation verification documents and printed booklets were examined for flaws or inaccuracies and, if necessary, the item was removed from the international database for that country.

## Statistics for Item Review

The TIMSS \& PIRLS International Study Center computed item statistics for all achievement items in the 2015 assessments, including TIMSS fourth grade ( 169 mathematics items and 176 science items), TIMSS eighth grade ( 212 mathematics items and 220 science items), and TIMSS Numeracy ( 124 items). The item statistics for each of the participating countries were then carefully reviewed. Exhibits 11.1 and 11.2 show actual samples of the statistics calculated for a multiple-choice and a constructed response item, respectively.

Exhibit 1 1.2: Example International Item Statistics for a TIMSS 2015 Constructed Response Item

For all items, regardless of format (i.e., multiple-choice or constructed response), statistics included the number of students that responded in each country, the difficulty level (the percentage of students that answered the item correctly), and the discrimination index (the point-biserial correlation between success on the item and total score). ${ }^{1}$ Also provided was an estimate of the difficulty of the item using a Rasch one-parameter IRT model. Statistics for each item were displayed alphabetically by country, together with an international average-i.e., based on all participating countries listed above the international average-and a reference average-based on a pool of countries that have participated regularly in the TIMSS assessments-for each statistic. The reference countries are shown with an asterisk next to their names. The international and reference averages of the item difficulties and item discriminations served as guides to the overall statistical properties of the items. The item review outputs also listed the benchmarking participants.

Statistics displayed for multiple-choice items included the percentage of students that chose each response option-as well as the percentage of students that omitted or did not reach the item and the point-biserial correlations for each response option. Statistics displayed for constructed response items (which could have 1 or 2 score points) included the percent correct and pointbiserial of each score level. Constructed response item tables also provided information about the reliability with which each item was scored in each country, showing the total number of doublescored responses, the percentage of score agreement between the scorers, and-because TIMSS has a 2-digit scoring scheme-the percentage of code agreement between scorers.

During item review, "not reached" responses (i.e., items toward the end of the booklet that the student did not attempt) ${ }^{2}$ were treated as "not administered" and thus did not contribute to the calculation of the item statistics. However, the percentage of students not reaching each item was reported. Omitted responses, although treated as incorrect, were tabulated separately from incorrect responses for the sake of distinguishing students who provided no form of response from students who attempted a response.

The definitions and detailed descriptions of the statistics that were calculated are given below. The statistics were calculated separately by grade and subject, and within each table are listed in order of their appearance in the item review outputs:

CASES: This is the number of students to whom the item was administered. Not-reached responses were not included in this count.

DIFF: The item difficulty is the average percent correct on an item. For a 1-point item, including all multiple-choice items, it is the percentage of students providing a fully correct response to the item. For 2-point items, it is the average percentage of points. For example, if 25 percent of students scored 2 points, 50 percent scored 1 point on a 2-point item, and the

1 For computing point-biserial correlations, the total score is the percentage of points a student has scored on the items (s)he was administered. In the context of TIMSS, a separate total score is computed for mathematics and for science. Not-reached responses are not included in the total score.
2 An item was considered "not reached" if the item itself and the item immediately preceding it were not answered and no subsequent items had been attempted. The decision as to whether an item was not reached was made separately for part 1 and part 2 of each assessment booklet.
other 25 percent score 0 points, then the average percent correct for such an item would be 50 percent. For this statistic, not-reached responses were not included.

DISC: The item discrimination is computed as the correlation between the response to an item and the total score on all items administered to a student. Items exhibiting good measurement properties should have a moderately positive correlation, indicating that the more able students get the item right, the less able get it wrong. For this statistic, not-reached items were not included.

PCT_A, PCT_B, PCT_C, and PCT_D: Available for multiple-choice items. Each column indicates the percentage of students choosing the particular response option for the item (A, B, C, or D). Not-reached responses were excluded from the denominator.

PCT_0, PCT_1, and PCT_2: Available for constructed response items. Each column indicates the percentage of students responding at that particular score level, up to and including the maximum score level for the item. Not-reached items were excluded from the denominator.

PCT_OM: Percentage of students who, having reached the item, did not provide a response. Not reached responses were excluded from the denominator.

PCT_NR: Percentage of students who did not reach the item. This statistic is the number of students who did not reach an item as a percentage of all students who were administered that item, including those who omitted or did not reach that item.

PB_A, PB_B, PB_C, and PB_D: Available for multiple-choice items. These columns show the point-biserial correlations between choosing each of the response options ( $\mathrm{A}, \mathrm{B}, \mathrm{C}$, or D ) and the total score on all of the items administered to a student. Items with good psychometric properties have moderately positive correlations for the correct option and negative correlations for the distracters (the incorrect options). Not-reached responses were not included in these calculations.

PB_0, PB_1, and PB_2: Available for constructed response items. These columns present the point-biserial correlations between the score levels on the item ( 0,1, or 2 ) and the overall score on all of the items the student was administered. For items with good measurement properties, the correlation coefficients should monotonically increase from negative to positive as the score on the item increases. Not-reached responses were not included in these calculations.

PB_OM: The point-biserial correlation between a binary variable indicating an omitted response to the item, and the total score on all items administered to a student. This correlation should be negative or near zero. Not-reached responses were not included in this statistic.

PB_NR: The point-biserial correlation between a binary variable indicating a not-reached response to the item, and the total score on all items administered to a student. This correlation should be negative or near zero.

RDIFF: An estimate of the difficulty of an item based on a Rasch one-parameter IRT model applied to the achievement data of a given country. The difficulty estimate is expressed in the logit metric (with a positive logit indicating a difficult item) and was scaled so that the average Rasch item difficulty across all items within each country was zero.

Reliability (N): To provide a measure of the reliability of the scoring of the constructed response items, items in approximately 25 percent of the test booklets in each country were independently scored by two scorers. This column indicates the number of responses that were double-scored for a given item in a country.

Reliability (Score): This column contains the percentage of agreement on the score value of the two-digit diagnostic codes assigned by the two independent TIMSS scorers.

Reliability (Code): This column contains the percentage of agreement on the two-digit diagnostic codes assigned by the two independent TIMSS scorers.

As an aid to the reviewers, the item-review displays included a series of flags signaling the presence of one or more conditions that might indicate a problem with an item. The following conditions were flagged:

- The item discrimination (DISC) was less than 0.10 (flag D)
- The item difficulty (DIFF) was less than .25 for multiple-choice items (flag C)
- The item difficulty (DIFF) exceeded .95 (flag V)
- The Rasch difficulty estimate (RDIFF) for a given country made the item either easier (flag E) or more difficult (flag H) relative to the international average for that item
- The point-biserial correlation for at least one distracter in a multiple-choice item was positive, or the point-biserial correlations across the score levels of a constructed response item were not ordered (flag A)
- The percentage of students selecting one of the response options for a multiple-choice item, or one of the score values for a constructed response item, was less than 10 percent (flag F)
- Scoring reliability for agreement on the score value of a constructed response item was less than 85 percent (flag R)

Although not all of these conditions necessarily indicated a problem, the flags were a useful tool to draw attention to potential sources of concern.

## Item-by-Country Interaction

Although countries are expected to exhibit some variation in performance across items, in general countries with high average performance on the assessment should perform relatively well on each of the items, and low-scoring countries should do less well on each of the items. When this does not occur (e.g., when a high-performing country has low performance on an item on which other countries are doing well), there is said to be an item-by-country interaction. When large, such item-by-country interactions may be a sign that an item is flawed in some way and that steps should be taken to address the problem. To assist in detecting sizeable item-by-country interactions, the TIMSS \& PIRLS International Study Center produced a graphical display for each item showing the difference between each country's Rasch item difficulty and the international average Rasch item difficulty across all countries. An example of the graphical displays is provided in Exhibit 11.3.

Exhibit 11.3: Example Plot of Item-by-Country Interaction for a TIMSS 2015 Item

In each of these item-by-country interaction displays, the difference in Rasch item difficulty for each country is presented as a 95 percent confidence interval, which includes a built-in Bonferroni correction for multiple comparisons across the participating countries. The limits for this confidence interval were computed as follows:

$$
\begin{aligned}
& \text { Upper Limit }=R D I F F_{i .}-R D I F F_{i k}+S E\left(R D I F F_{i k}\right) \cdot Z_{b} \\
& \text { Lower Limit }=R D I F F_{i .}-R D I F F_{i k}-S E\left(R D I F F_{i k}\right) \cdot Z_{b}
\end{aligned}
$$

where $R D I F F_{i k}$ is the Rasch difficulty of item $i$ in country $k, R D I F F_{i}$ is the international average Rasch difficulty of item $i, \operatorname{SE}\left(\right.$ RDIFF $\left._{i k}\right)$ is the standard error of the Rasch difficulty of item $i$ in country $k$, and $Z_{b}$ is the $95 \%$ critical value from the Z distribution corrected for multiple comparisons using the Bonferroni procedure.

## Trend Item Review

In order to measure trends, TIMSS 2015 included achievement items from previous assessments as well as items developed for use for the first time in 2015. Accordingly, the TIMSS 2015 assessments included items from 2007, 2011, and 2015. An important review step, therefore, was to check that these "trend items" had statistical properties in 2015 similar to those they had in the previous assessments (e.g., a TIMSS item that was relatively easy in 2011 should still be relatively easy in 2015).

As can be seen in the example in Exhibit 11.4, the trend item review focused on statistics for trend items from the current and previous assessments (2015 and 2011) for countries that participated in both. For each country, trend item statistics included the percentage of students in each score category (or response option for multiple-choice items) for each assessment, as well as the difficulty of the item and the percent correct by gender. In reviewing these item statistics, the aim was to detect any unusual changes in item difficulties between administrations, which might indicate a problem in using the item to measure trends.

TIMSS

TIMSS
2015

Exhibit 11.4: Example Item Statistics for a TIMSS 2015 Trend Item (Continued)

While some changes in item difficulties were anticipated as countries' overall achievement may have improved or declined, items were noted if the difference between the Rasch difficulties across the two assessments for a particular country was greater than 2 logits. The TIMSS \& PIRLS International Study Center used two different graphical displays to examine the differences in item difficulties. The first of these, shown for an example item in Exhibit 11.5, displays the difference in Rasch item difficulty of the item between 2015 and 2011 for each country. A positive difference for a country indicates that the item was relatively easier in 2015, and a negative difference indicates that the item was relatively more difficult.

## Exhibit 11.5: Example Plot of Differences in Rasch Item Difficulties Between 2015 and 2011

 for a TIMSS 2015 Trend Item

The second graphical display, presented in Exhibit 11.6, shows the performance of a given country on all trend items simultaneously. For each country, the graph plots the 2015 Rasch difficulty of every trend item against its Rasch difficulty in 2011. Where there were no differences between the difficulties in the two successive administrations, the data points aligned on or near the diagonal.

Exhibit 11.6: Example Plot of Rasch Item Difficulties Across TIMSS Trend Items by Country

## Reliability

Documenting the reliability of the TIMSS 2015 assessments was a critical quality control step in reviewing the items. As one indicator of reliability, the review considered Cronbach's Alpha coefficient of reliability calculated at the assessment booklet level. Secondly, the scoring of the constructed response items had to meet specific reliability criteria in terms of consistent withincountry scoring, cross-country scoring, and across assessment or trend-scoring.

## Test Reliability

Exhibits 11.7 and 11.8 display the TIMSS 2015 fourth and eighth grade mathematics and science test reliability coefficients for every country, respectively. Exhibit 11.7 also displays the test reliability coefficients for TIMSS Numeracy. These coefficients are the median Cronbach's alpha reliability across all TIMSS 2015 assessment booklets. In general, reliabilities were relatively high. For TIMSS at the fourth grade, the international median reliability (the median of the reliability coefficients for all countries) was 0.83 for mathematics and 0.78 for science, and at the eighth
grade, 0.88 for mathematics and 0.83 for science. The international median reliability for TIMSS Numeracy was 0.92.

## Scoring Reliability for Constructed Response Items

A sizeable proportion of the items in the TIMSS 2015 assessments were constructed response items, comprising about half of the assessment score points. An essential requirement for use of such items is that they be reliably scored by all participants. That is, a particular student response should receive the same score, regardless of the scorer. In conducting TIMSS 2015, measures taken to ensure that the constructed response items were scored reliably in all countries included developing scoring guides for each constructed response question (that provided descriptions of acceptable responses for each score point value) and providing extensive training in the application of the scoring guides. See Chapter 1: Developing the TIMSS 2015 Achievement Items for more information on the scoring guides and see Chapter 6: Survey Operations Procedures for information on the scoring process.

## Within-Country Scoring Reliability

To gather and document information about the within-country agreement among scorers for TIMSS 2015, a random sample of approximately 25 percent of the assessment booklets was selected to be scored independently by two scorers. The inter-scorer agreement for each item in each country was examined as part of the item review process. Exact percent agreement across items was high on average across countries- 96 percent or above, on average internationally. In TIMSS 2015 there also was high agreement at the diagnostic score level, where percent agreement
ranged from 94 percent in science at the eighth grade to 98 percent in mathematics at the fourth grade, on average. See Appendix 11A for the average and range of the within-country percentage of correctness score agreement across all items. The TIMSS Within-Country Scoring Reliability documents also provide the average and range of the within-country percentage of diagnostic score agreement.

## Trend Item Scoring Reliability

The TIMSS \& PIRLS International Study Center also took steps to show that the 2015 constructed response items used in TIMSS 2011 were scored in the same way in both assessments. In anticipation of this, countries that participated in TIMSS 2011 sent samples of scored student booklets from the 2011 data collections to the IEA Data Processing and Research Center (IEA DPC), where they were digitally scanned and stored for later use. As a check on scoring consistency from one administration to the next, staff members working in each country on scoring the 2015 data were asked also to score these 2011 responses using the Trend Reliability Scoring Software developed by the IEA DPC. Each country scored 200 responses for each of 21 mathematics and 23 science items at the fourth grade, and 27 mathematics and 33 science items at the eighth grade.

There was a very high degree of scoring consistency in TIMSS 2015. The exact agreement between the scores awarded in 2011 and those given by the 2015 scorers ranged from 92 percent in science to 98 percent in mathematics at the fourth grade, on average internationally. There also was high agreement in TIMSS at the diagnostic score level, although somewhat less in science than in mathematics, on average. The average and range of scoring consistency over time can be found in Appendix 11B.

## Cross-Country Scoring Reliability Study

It also was important to document the consistency of scoring across countries. Because of the many different languages in use in TIMSS 2015, establishing the reliability of constructed response scoring across all countries was not feasible. However, the TIMSS \& PIRLS International Study Center did conduct a cross-country study of scoring reliability among Northern Hemisphere countries that had scorers who were proficient in English. A sample of student responses was provided by the English-speaking Southern Hemisphere countries. Cross-country scoring included 200 student responses for each of 11 mathematics and 10 science items at the fourth grade, and 13 mathematics and 13 science items at the eighth grade. This set of student responses in English was then scored independently in each country that had two scorers proficient in English, using the Cross-country Scoring Reliability Software provided by the IEA DPC. In all, scorers from 46 countries at fourth grade and 37 countries at eighth grade participated in the study. Scoring for this study took place shortly after the other scoring reliability activities were completed. Making all possible comparisons among scorers gave 1,035 comparisons at fourth grade and 666 comparisons at eighth grade for each student response to each item. This resulted in more than 130,000 total
comparisons at each grade and subject when aggregated across all 200 student responses to that item. Agreement across countries was defined in terms of the percentage of these comparisons that were in exact agreement.

On average internationally, scorer reliability across countries in TIMSS 2015 was high. The exact agreement between the scores awarded across countries ranged from 86 percent in science to 97 percent in mathematics at the fourth grade and from 83 percent in science to 93 percent in mathematics at the eighth grade, on average internationally. There also was high agreement at the diagnostic score level, where percent agreement ranged from 79 percent in science at the eighth grade to 97 percent in mathematics at the fourth grade, on average. See Appendix 11C for the results of the cross-country scoring reliability study.

## Item Review Procedures

Using the information from the comprehensive collection of item analyses and reliability data that were computed and summarized for TIMSS 2015, the TIMSS \& PIRLS International Study Center thoroughly reviewed all item statistics for every participating country and benchmarking participant to ensure that the items were performing comparably across countries. In particular, items with the following problems were considered for possible deletion from the international database:

- An error was detected during translation verification but was not corrected before test administration
- Data checking revealed a multiple-choice item with more or fewer options than in the international version
- The item analysis showed the item to have a negative biserial, or, for an item with more than 1 score point, point biserials that did not increase with each score level
- The item-by-country interaction results showed a very large negative interaction for a particular country
- For constructed response items, the within-country scoring reliability data showed an agreement of less than 70 percent
- For trend items, an item performed substantially differently in 2015 compared to the TIMSS 2011 administration, or an item was not included in the previous assessment for a particular country

When the item statistics indicated a problem with an item, the documentation from the translation verification was used as an aid in checking the test booklets. If a question remained about potential translation or cultural issues, however, then the National Research Coordinator was consulted before deciding how the item should be treated.

The checking of the TIMSS 2015 achievement data involved review of more than 750 items and resulted in the detection of very few items that were inappropriate for international comparisons. Among the few items singled out in the review process were mostly items with differences attributable to either translation or printing problems. See Appendix 11D: Country Adaptations to Items and Item Scoring for a list of deleted items, as well as a list of recodes made to constructed response item codes. There also were a number of items in each study that were combined, or derived, for scoring purposes. See Appendix 11E for details about how score points were awarded for each derived item.

## Appendix 11E: Derived Items in TIMSS 2015

## TIMSS Fourth Grade Mathematics

M051061Z, M06_08 - Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M061018, M10_01 - Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M061240, M14_01 - Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

## TIMSS Numeracy

MN11042, N01_10 - Item parts B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)

## TIMSS Fourth Grade Science

S041149Z, S01_10 - Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts $A$ and $B$ are correct, 1 score point is awarded if either part $A$ or part B is correct, and 0 score points are awarded if both parts A and B are incorrect

S051026Z, S03_05 - Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S051121Z, S03_08 - Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S051188Z, S06_08 - Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S061083, S10_06 - Item parts B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)

S061142A, S10_09 - Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S051138Z, S11_03 - Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct (part C was deleted)

S061124, S14_11 - Item parts B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)

S061116, S14_12 - Item parts B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)

## TIMSS Eighth Grade Mathematics

M062208, M02_01 - Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M042229Z, M05_10 - Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts $A$ and $B$ are correct, 1 score point is awarded if only part $A$ or only part $B$ is correct, and 0 score points are awarded if both parts $A$ and $B$ are incorrect

## TIMSS Eighth Grade Science

S062189, S02_01 - Item parts A, B, D, and E are combined to create a 2-point item, where 2 score points are awarded if all parts are correct, 1 score point is awarded if 3 parts are correct, and 0 score points are awarded if 2 or fewer parts are correct (part C was deleted)

S062010, S02_05 - Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S052092Z, S03_02 - Item parts A, B, C, and D were combined to create a 2-point item, where 2 score points are awarded if all parts are correct, 1 score point is awarded if 2 or 3 parts are correct, and 0 score points are awarded if 1 or 0 parts are correct
S052043Z, S03_07 - Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S062018, S04_08 - Item parts A, B, C, D, and E are combined to create a 2-point item, where 2 points are awarded if all parts are correct, 1 point is awarded if 4 parts are correct, and 0 score points are awarded if 3 or fewer parts are correct

S062173A, S10_13 - Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S052015Z, S11_05 - Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S062242, S12_15 - Item parts A, B, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part C was deleted)
S052095Z, S13_05 - Item parts B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)

S062047, S14_07 - Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S062022, S14_14 - Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

## CHAPTER 12

## TIMSS 2015 Achievement Scaling Methodology ${ }^{1}$

The TIMSS approach to scaling the achievement data, based on item response theory (IRT) scaling with marginal estimation, was developed originally by Educational Testing Service for use in the U.S. National Assessment of Educational Progress (NAEP). It is based on psychometric models that were first used in the field of educational measurement in the 1950s and have become popular since the 1970s for use in large-scale surveys, test construction, and computer adaptive testing. ${ }^{2}$

Three distinct IRT models, depending on item type and scoring procedure, were used in the analysis of the TIMSS 2015 assessment data. Each is a "latent variable" model that describes the probability that a student will respond in a specific way to an item in terms of the student's proficiency, which is an unobserved or "latent" trait, and various characteristics (or "parameters") of the item. A three-parameter model was used with multiple-choice items, which were scored as correct or incorrect, and a two-parameter model for constructed response items with just two response options, which also were scored as correct or incorrect. Since each of these item types has just two response categories, they are known as dichotomous items. A partial credit model was used with polytomous constructed response items, i.e., those with more than two response options.

## Two- and Three-Parameter IRT Models for Dichotomous Items

The fundamental equation of the three-parameter (3PL) model gives the probability that a student whose proficiency on a scale $k$ is characterized by the unobservable variable $\theta_{k}$ will respond correctly to item $i$ as:

$$
\begin{equation*}
P\left(x_{i}=1 \mid \theta_{k}, a_{i}, b_{i}, c_{i}\right)=c_{i}+\frac{1-c_{i}}{1+\exp \left(-1.7 \cdot a_{i} \cdot\left(\theta_{k}-b_{i}\right)\right)} \equiv P_{i, 1}\left(\theta_{k}\right) \tag{1}
\end{equation*}
$$

[^6]where
$x_{i}$ is the response to item $i, 1$ if correct and 0 if incorrect;
$\theta_{k}$ is the proficiency of a student on a scale $k$ (note that a student with higher proficiency has a greater probability of responding correctly);
$a_{i}$ is the slope parameter of item $i$, characterizing its discriminating power;
$b_{i}$ is the location parameter of item $i$, characterizing its difficulty;
$c_{i}$ is the lower asymptote parameter of item $i$, reflecting the chances of students with very low proficiency selecting the correct answer.

The probability of an incorrect response to the item is defined as:

$$
\begin{equation*}
P_{i, 0}=P\left(x_{i}=0 \mid \theta_{k}, a_{i}, b_{i}, c_{i}\right)=1-P_{i, 1}\left(\theta_{k}\right) \tag{2}
\end{equation*}
$$

The two-parameter (2PL) model was used for the constructed response items that were scored as either correct or incorrect. The form of the 2PL model is the same as Equations (1) and (2) with the $c_{i}$ parameter fixed at zero.

## IRT Model for Polytomous Items

In TIMSS, constructed response items requiring an extended response were scored for partial credit, with 0,1 , and 2 as the possible score levels. These polytomous items were scaled using a generalized partial credit model (Muraki, 1992). The fundamental equation of this model gives the probability that a student with proficiency $\theta_{k}$ on scale $k$ will have, for the $i^{\text {th }}$ item, a response $x_{i}$ that is scored in the $l^{\text {th }}$ of $m_{i}$ ordered score categories as:

$$
\begin{equation*}
P\left(x_{i}=l \mid \theta_{k}, a_{i}, b_{i}, d_{i, 1} \cdots, d_{i, m_{i}-1}\right)=\frac{\exp \left(\sum_{v=0}^{l} 1.7 \cdot a_{i} \cdot\left(\theta_{k}-b_{i}+d_{i, v}\right)\right)}{\sum_{g=0}^{m_{i}-1} \exp \left(\sum_{v=0}^{g} 1.7 \cdot a_{i} \cdot\left(\theta_{k}-b_{i}+d_{i, v}\right)\right)}=P_{i, l}\left(\theta_{k}\right) \tag{3}
\end{equation*}
$$

where
$m_{i}$ is the number of response categories for item $i$, usually 3 ;
$x_{i}$ is the response to item $i$, ranging between 0 and $m_{i}-1$;
$\theta_{k}$ is the proficiency of a student on a scale $k$;
$a_{i}$ is the slope parameter of item $i$;
$b_{i}$ is its location parameter, characterizing its difficulty;
$d_{i, l}$ is the category $l$ threshold parameter.
The indeterminacy of model parameters in the polytomous model is resolved by setting $d_{i, 0}=0$ and $\sum_{j=1}^{m_{i}-1} d_{i, j}=0$.

For all of the IRT models there is a linear indeterminacy between the values of item parameters and proficiency parameters, i.e., mathematically equivalent but different values of item parameters can be estimated on an arbitrarily linearly transformed proficiency scale. This linear indeterminacy can be resolved by setting the origin and unit size of the proficiency scale to arbitrary constants, such as a mean of 500 and a standard deviation of 100, as was done originally for TIMSS in 1995. The indeterminacy is most apparent when the scale is set for the first time.

IRT modeling relies on a number of assumptions, the most important being conditional independence. Under this assumption, item response probabilities depend only on $\theta_{k}$ (a measure of a student's proficiency) and the specified parameters of the item, and are unaffected by the demographic characteristics or unique experiences of the students, the data collection conditions, or the other items presented in the test. Under this assumption, the joint probability of a particular response pattern $x$ across a set of $n$ items is given by:

$$
\begin{equation*}
P\left(x \mid \theta_{k}, \text { item parameters }\right)=\prod_{i=1}^{n} \prod_{l=0}^{m_{i}-1} P_{i, l}\left(\theta_{k}\right)^{u_{i, l}} \tag{4}
\end{equation*}
$$

where $P_{i, l}\left(\theta_{k}\right)$ is of the form appropriate to the type of item (dichotomous or polytomous), $m_{i}$ is equal to 2 for dichotomously scored items, and $u_{i, l}$ is an indicator variable defined as:

$$
u_{i, l}=\left\{\begin{array}{l}
1 \text { if response is } x_{i} \text { is in category } l ;  \tag{5}\\
0 \text { otherwise }
\end{array}\right.
$$

Replacing the hypothetical response pattern with the real scored data, the above function can be viewed as a likelihood function to be maximized by a given set of item parameters. In TIMSS, the item parameters for each scale are estimated independently of the parameters of other scales. Once items were calibrated in this manner, a likelihood function for the proficiency $\theta_{k}$ was induced from student responses to the calibrated items. This likelihood function for the proficiency $\theta_{k}$ is called the posterior distribution of the $\theta$ 's for each student.

## Proficiency Estimation Using Plausible Values

Most cognitive skills testing is concerned with accurately assessing the performance of individual students for the purposes of diagnosis, selection, or placement. Regardless of the measurement model used, whether classical test theory or item response theory, the accuracy of these measurements can be improved-that is, the amount of measurement error can be reduced-by increasing the number of items given to the individual. Thus, it is common to see achievement tests designed to provide information on individual students that contain more than 70 items. Since the uncertainty associated with each $\theta$ in such tests is negligible, the distribution of $\theta$, or the joint distribution of $\theta$ with other variables, can be approximated using each individual's estimated $\theta$.

For the distribution of proficiencies in large populations, however, more efficient estimates can be obtained from a matrix-sampling design like that used in TIMSS. This design solicits relatively few responses from each sampled student while maintaining a wide range of content representation when responses are aggregated across all students. With this approach, however, the advantage of estimating population characteristics more efficiently is offset by the inability to make precise statements about individuals. Indeed, the uncertainty associated with individual $\theta$ estimates becomes too large to be ignored. In this situation, aggregations of individual student scores can lead to seriously biased estimates of population characteristics (Wingersky, Kaplan, \& Beaton, 1987).

Plausible values methodology was developed as a way to address this issue. Instead of first computing estimates of individual $\theta$ 's and then aggregating these to estimate population parameters, the plausible values approach uses all available data, students' responses to the items they were administered together with all background data, to estimate directly the characteristics of student populations and subpopulations. Although these directly estimated population characteristics could be used for reporting purposes, instead the usual plausible values approach is to generate multiple imputed scores, called plausible values, from the estimated ability distributions and to use these in analyses and reporting, making use of standard statistical software. By including all available background data in the model, a process known as "conditioning", relationships between these background variables and the estimated proficiencies will be appropriately accounted for in the plausible values. Because of this, analyses conducted using plausible values will provide an accurate representation of these underlying relationships. A detailed review of the plausible values methodology is given in Mislevy (1991). ${ }^{3}$

The following is a brief overview of the plausible values approach. Let $y$ represent the responses of all sampled students to background questions or background data of sampled students collected from other sources, and let $\theta$ represent the proficiency of interest. If $\theta$ were known for all sampled students, it would be possible to compute a statistic $t(\theta, y)$, such as a sample mean or sample percentile point, to estimate a corresponding population quantity $T$.

Because of the latent nature of the proficiency, however, $\theta$ values are not known even for sampled students. The solution to this problem is to follow Rubin (1987) by considering $\theta$ as "missing data" and approximate $t(\theta, y)$ by its expectation given $(x, y)$, the data that actually were observed, as follows:

$$
\begin{align*}
t^{*}(x, y) & =E|t(\underline{\theta}, \underline{y})| \underline{x}, \underline{y} \mid  \tag{6}\\
& =\int t(\underline{\theta}, \underline{y}) p(\underline{\theta} \mid \underline{x}, \underline{y}) d \underline{\theta}
\end{align*}
$$

3 Along with theoretical justifications, Mislevy presents comparisons with standard procedures; discusses biases that arise in some secondary analyses; and offers numerical examples.

It is possible to approximate $t^{*}$ using random draws from the conditional distribution of the scale proficiencies given the student's item responses $x_{j}$, the student's background variables $y_{j}$, and model parameters for the items. These values are referred to as imputations in the sampling literature, and as plausible values in large-scale surveys such as PIRLS, TIMSS, NAEP, NALS, and IALLS. The value of $\theta$ for any student that would enter into the computation of $t$ is thus replaced by a randomly selected value from his or her conditional distribution. Rubin (1987) proposed repeating this process several times so that the uncertainly associated with imputation can be quantified. For example, the average of multiple estimates of $t$, each computed from a different set of plausible values, is a numerical approximation of $t^{*}$ of the above equation; the variance among them reflects the uncertainty due to not observing $\underline{\theta}$. It should be noted that this variance does not include the variability of sampling from the population. That variability is estimated separately by a jackknife variance estimation procedure.

Plausible values are not intended to be estimates of individual student scores, but rather are imputed scores for like students-students with similar response patterns and background characteristics in the sampled population-that may be used to estimate population characteristics correctly. When the underlying model is correctly specified, plausible values will provide consistent estimates of population characteristics, even though they are generally biased estimates of the proficiencies of the individuals with whom they are associated. Taking the average of the plausible values still will not yield suitable estimates of individual student scores. ${ }^{4}$

Plausible values for each student $j$ are drawn from the conditional distribution $P\left(\theta_{j} \mid x_{j}, y_{j}, \Gamma, \Sigma\right)$, where $\Gamma$ is a matrix of regression coefficients for the background variables, and $\Sigma$ is a common variance matrix of residuals. Using standard rules of probability, the conditional probability of proficiency can be represented as:

$$
\begin{equation*}
P\left(\theta_{j} \mid x_{j}, y_{j}, \Gamma, \Sigma\right) \propto P\left(x_{j} \mid \theta_{j}, y_{j}, \Gamma, \Sigma\right) P\left(\theta_{j} \mid y_{j}, \Gamma, \Sigma\right)=P\left(x_{j} \mid \theta_{j}\right) P\left(\theta_{j} \mid y_{j}, \Gamma, \Sigma\right) \tag{7}
\end{equation*}
$$

where $\theta_{j}$ is a vector of scale values, $P\left(x_{j} \mid \theta_{j}\right)$ is the product over the scales of the independent likelihoods induced by responses to items within each scale, and $P\left(\theta_{j} \mid y_{j}, \Gamma, \Sigma\right)$ is the multivariate joint density of proficiencies for the scales, conditional on the observed values $y_{j}$ of background responses and parameters $\Gamma$ and $\Sigma$. Item parameter estimates are fixed and regarded as population values in the computations described in this section.

## Conditioning

A multivariate normal distribution was assumed for $P\left(\theta_{j} \mid y_{j}, \Gamma, \Sigma\right)$, with a common variance $\Sigma$, and with a mean given by a linear model with regression parameters $\Gamma$. Since in large-scale studies like TIMSS there are many hundreds of background variables, it is customary to conduct a principal components analysis to reduce the number of variables to be used in $\Gamma$. Typically, components accounting for 90 percent of the variance in the data are selected. These principal components are referred to as the conditioning variables and denoted as $y^{c}$. The following model is then fit to the data:

$$
\begin{equation*}
\theta=\Gamma^{\prime} y^{c}+\varepsilon \tag{8}
\end{equation*}
$$

where $\varepsilon$ is normally distributed with mean zero and variance $\Sigma$. As in a regression analysis, $\Gamma$ is a matrix each of whose columns is the effects for each scale and $\Sigma$ is the matrix of residual variance between scales.

Note that in order to be strictly correct for all functions $\Gamma$ of $\theta$, it is necessary that $P(\theta \mid y)$ be correctly specified for all background variables in the survey. Estimates of functions $\Gamma$ involving background variables not conditioned in this manner are subject to estimation error due to misspecification. The nature of these errors is discussed in detail in Mislevy (1991). In TIMSS, however, the principal components account for almost all of the variance in the student background variables, so that the computation of marginal means and percentile points of $\theta$ for these variables is nearly optimal.

The basic method for estimating $\Gamma$ and $\Sigma$ with the Expectation and Maximization (EM) procedure is described in Mislevy (1985) for a single scale case. The EM algorithm requires the computation of the mean $\theta$, and variance $\Sigma$, of the posterior distribution in Equation (7).

## Generating Proficiency Scores

After completing the EM algorithm, plausible values for all sampled students are drawn from the joint distribution of the values of $\Gamma$ in a three-step process. First, a value of $\Gamma$ is drawn from a normal approximation to $P\left(\Gamma, \Sigma \mid x_{j}, y_{j}\right)$ that fixes $\Sigma$ at the value $\hat{\Sigma}$ (Thomas, 1993). Second, conditional on the generated value of $\Gamma$ (and the fixed value of $\Sigma=\hat{\Sigma}$ ), the mean $\theta_{j}$ and variance $\Sigma_{j}^{p}$ of the posterior distribution in Equation (7), where $p$ is the number of scales, are computed using the methods applied in the EM algorithm. In the third step, the proficiency values are drawn independently from a multivariate normal distribution with mean $\theta_{j}$ and variance $\Sigma_{j}^{p}$. These three steps are repeated five times, producing five imputations of $\theta_{j}$ for each sampled student.

For students with an insufficient number of responses, the $\Gamma$ 's and $\Sigma$ 's described in the previous paragraph are fixed. Hence, all students-regardless of the number of items attempted—are assigned a set of plausible values.

The plausible values can then be employed to evaluate Equation (6) for an arbitrary function $T$ as follows:

- Using the first vector of plausible values for each student, evaluate $T$ as if the plausible values were the true values of $\theta$. Denote the result as $T_{1}$
- Evaluate the sampling variance of $T_{1}$, or $\operatorname{Var}_{1}$, with respect to students' first vector of plausible values
- Carry out steps 1 and 2 for the second through fifth vectors of plausible values, thus obtaining $T_{u}$ and $\operatorname{Var}_{u}$, for $u=2, \ldots, 5$
- The best estimate of $T$ obtainable from the plausible values is the average of the five values obtained from the different sets of plausible values:

$$
\begin{equation*}
\hat{T}=\frac{\sum_{u} T_{u}}{5} \tag{9}
\end{equation*}
$$

- An estimate of the variance of $\hat{T}$ is the sum of two components: an estimate of $\operatorname{Var}_{u}$ obtained by averaging as in the previous step, and the variance among the $T_{u}$ 's
Let $\bar{U}=\frac{\sum_{u} \operatorname{Var}_{u}}{M}$, and let $B_{M}=\frac{\sum_{u}\left(T_{u}-\widehat{T}\right)^{2}}{M-1}$ be the variance among the $M$ plausible values
Then the estimate of the total variance of $\hat{T}$ is:

$$
\begin{equation*}
\operatorname{Var}(\widehat{T})=\bar{U}+\left(1+M^{-1}\right) B_{M} \tag{10}
\end{equation*}
$$

The first component in $\operatorname{Var}(\hat{T})$ reflects the uncertainty due to sampling students from the population; the second reflects the uncertainty due to the fact that sampled students' $\theta$ 's are not known precisely, but only indirectly through $x$ and $y$.

## Working with Plausible Values

The plausible values methodology is used in TIMSS to ensure the accuracy of estimates of the proficiency distributions for the TIMSS populations as a whole and particularly for comparisons between subpopulations. A further advantage of this method is that the variation between the five plausible values generated for each student reflects the uncertainty associated with proficiency estimates for individual students. However, retaining this component of uncertainty requires that additional analytical procedures be used to estimate students' proficiencies.

If the $\theta$ values were observed for all sampled students, the statistic $(t-T) / U^{\frac{1}{2}}$ would follow a $t$-distribution with $d$ degrees of freedom. Then the incomplete-data statistic $(T-\hat{T}) /[\operatorname{Var}(\hat{T})]^{\frac{1}{2}}$ is approximately $t$-distributed, with degrees of freedom (Johnson \& Rust, 1993) given by:

$$
\begin{equation*}
v=\frac{1}{\frac{f_{M}^{2}}{M-1}+\frac{\left(1-f_{M}\right)^{2}}{d}} \tag{11}
\end{equation*}
$$

where $d$ is the degrees of freedom for the complete-data statistic, and $f_{M}$ is the proportion of total variance due to not observing the values:

$$
\begin{equation*}
f_{M}=\frac{\left(1+M^{-1}\right) B_{M}}{\operatorname{Var}(\widehat{T})} \tag{12}
\end{equation*}
$$

When $B_{M}$ is small relative to $\bar{U}$, the reference distribution for the incomplete-data statistic differs little from the reference distribution for the corresponding complete-data statistic. If, in addition, $d$ is large, the normal approximation can be used instead of the $t$-distribution.

For a $k$-dimensional function $T$, such as the $k$ coefficients in a multiple regression analysis, each $U$ and $\bar{U}$ is a covariance matrix, and $B_{M}$ is an average of squares and cross-products rather than simply an average of squares. In this case, the quantity $(\underline{T}-\underline{\hat{T}}) \operatorname{Var}^{-1}(\underline{\hat{T}})(\underline{T}-\underline{\hat{T}})^{\prime}$ is approximately $F$-distributed with degrees of freedom equal to $k$ and $v$, with $v$ defined as above but with a matrix generalization of $f_{M}$ :

$$
\begin{equation*}
f_{M}=\left(1+M^{-1}\right) \operatorname{Trace}\left[B_{M} \operatorname{Var}^{-1}(\widehat{T})\right] / k \tag{13}
\end{equation*}
$$

For the same reason that the normal distribution can approximate the $t$-distribution, a chi-square distribution with $k$ degrees of freedom can be used in place of the $F$-distribution for evaluating the significance of the above quantity $(\underline{T}-\underline{\hat{T}}) \operatorname{Var}^{-1}(\underline{\hat{T}})(\underline{T}-\underline{\hat{T}})^{\prime}$.

Statistics $\hat{T}$, the estimates of proficiency conditional on responses to cognitive items and background variables, are consistent estimates of the corresponding population values $T$, as long as background variables are included in the conditioning variables. The consequences of violating this restriction are described by Beaton and Johnson (1992), Mislevy (1991), and Mislevy and Sheehan (1987). To avoid such biases, the TIMSS analyses include nearly all student background variables, in the form of principal components, as well as the class means to preserve betweenclass differences-the between-classroom and within-classroom variance structure essential for hierarchical modeling.

## CHAPTER 13

## Scaling the TIMSS 2015 Achievement Data

Pierre Foy Liqun Yin

## Overview

The TIMSS assessments cover a wide range of topics in mathematics and science across two grade levels. Given this broad coverage, a matrix-sampling booklet design is used such that each student is administered only a subset of the entire TIMSS mathematics and science item pools (see Chapter 4 of TIMSS 2015 Assessment Frameworks). Given the complexities of the data collection and the need to have student scores on the entirety of each assessment for analysis and reporting purposes, TIMSS relies on item response theory (IRT) scaling to describe student achievement and to provide accurate measures of trends. As each student responded to only a part of the assessment item pool, the TIMSS scaling approach uses multiple imputation-or plausible values-methodology to obtain proficiency scores in mathematics and science for all students. To enhance the reliability of the student scores, the TIMSS scaling approach uses conditioning, a process in which student responses to the items are combined with information about students' backgrounds.

This scaling chapter begins with a general description of the scaling approach and its use of plausible values. It then describes the concurrent calibration method used specifically to measure trends. Next, it explains how the proficiency scores are generated through the use of conditioning and describes the process of transforming the proficiency scores to place them on the metrics used to measure trends. A special section describes how the TIMSS Numeracy 2015 achievement data were scaled and placed on the TIMSS fourth grade mathematics reporting scale. A description of the technical details involved in the scaling can be found in Chapter 12: TIMSS 2015 Achievement Scaling Methodology.

## Implementing the TIMSS Scaling Procedures

The application of IRT scaling and plausible values methodology to the data from the TIMSS assessments involves four major tasks: calibrating the achievement items (estimating model parameters for each item), creating principal components from the student questionnaire data for use in conditioning, generating proficiency scores for mathematics and science, and placing these proficiency scores on the metrics used to report trend results from previous assessments. TIMSS has separate scales for mathematics and science at both fourth and eighth grades. New for TIMSS 2015, the TIMSS Numeracy achievement results will be reported on the TIMSS fourth grade mathematics scale. The scaling procedures also generate proficiency scores for the domains of the overall subjects: the content and cognitive domains of mathematics and science.

## Linking Assessments Cycles with Concurrent Calibration

The metric of the TIMSS reporting scales for overall mathematics and science at each grade level were originally established in TIMSS 1995 by setting the mean of the national average scores for all countries that participated in TIMSS 1995 to 500 and the standard deviation to 100. To enable measurement of trends over time, achievement data from successive TIMSS assessments were transformed to these same metrics. This is done by concurrently scaling the data from each successive assessment with the data from the previous assessment-a process known as concurrent calibration-and applying linear transformations to place the results from each successive assessment on the same scale as the results from the previous assessment. This procedure enables TIMSS to measure trends across all six assessment cycles: 1995, 1999, 2003, 2007, 2011, and 2015. ${ }^{1}$

The first step in linking the assessments for trend scaling is to estimate (calibrate) the item parameters for the items in the current assessment through a concurrent calibration of the data from the current assessment and from the previous assessment. In 2015, the TIMSS concurrent calibration consisted of combining achievement data from the 2015 and 2011 assessments.

In linking successive assessments, concurrent calibration relies on having a large proportion of trend items, items that are retained from one assessment to the next. The TIMSS assessment consists of 14 mathematics item blocks and 14 science item blocks at each grade. In TIMSS 2015, 6 of the mathematics blocks and 6 of the science blocks consisted of newly developed items. The remaining 8 mathematics blocks and 8 science blocks were carried forward from the TIMSS 2011 assessment and are the basis for linking TIMSS 2015 to the TIMSS achievement scale and maintaining trends over time. Exhibits 13.1 through 13.4 list the number of items present for TIMSS concurrent calibration by item type and content and cognitive domain for both grades and subjects, respectively.

In concurrent calibration, item parameters for the current assessment are estimated based on the data from both the current and previous assessments, recognizing that some items (the trend items) are common to both. It is then possible to estimate the latent ability distributions of students in both assessments using the item parameters from the concurrent calibration. The difference between these two distributions is the change in achievement between the previous and current assessments.

After the calibration, the next step is to find a linear transformation that transforms the distribution of the previous assessment data under the concurrent calibration to match the distribution of these same data under the calibration that was done in the previous assessment. The final step entails applying this linear transformation to the current assessment data scaled using the concurrent calibration. This places the current assessment data on the trend scale.

Exhibit 13.5 illustrates how the concurrent calibration approach is applied in the context of TIMSS trend scaling. The gap between the distributions of the previous assessment data under the previous calibration and under the concurrent calibration is typically small and is the result of slight differences in the item parameter estimates from the two calibrations (Exhibit 13.5 , second panel). The linear transformation removes this gap by shifting the two distributions from the concurrent calibration such that the distribution of the previous assessment data from the concurrent calibration aligns with the distribution of the previous assessment data from the previous calibration, ${ }^{2}$ while preserving the gap between the previous and current assessment data under the concurrent calibration. This latter gap is the change in achievement between the previous and current assessments that TIMSS sets out to measure as trend.

Exhibit 13.5: Concurrent Calibration Model Used for TIMSS

## Calibrating the TIMSS 2015 Assessment Data

Item calibration was conducted by the TIMSS \& PIRLS International Study Center using the commercially-available Parscale software (Muraki \& Bock, 1991) and included data from the previous assessment (TIMSS 2011) and data from the 2015 assessment for countries that participated in both assessment cycles. The calibration used all available item response data from each country's student samples and from both current and previous assessments. All student samples were weighted so that each country contributed equally to the item calibration. Exhibits 13.6 and 13.7 show the sample sizes for scaling the TIMSS 2015 data. A total of 41

[^8]countries from TIMSS 2015 contributed to the concurrent calibration at the fourth grade; 34 countries contributed at the eighth grade. Norway's data at the fourth and eighth grades were included in the concurrent calibrations.

The item parameters estimated from these concurrent calibrations, based on the countries that have participated in both the previous and current assessments, were used to estimate student proficiency for all countries and benchmarking entities participating in the TIMSS 2015 assessments. These item parameters were also used to estimate student proficiency in the mathematics and science content and cognitive domains. At the fourth grade, student proficiency was estimated for a total of 47 countries and seven benchmarking participants, as shown in Exhibit 13.6. At the eighth grade, it was estimated for 39 countries and seven benchmarking participants. The item parameters estimated from the TIMSS concurrent calibrations at the fourth and eighth grades and for mathematics and science are presented in Appendix 13A-13D.

## Treatment of Omitted and Not-Reached Responses

Given the matrix-sampling design used by TIMSS, whereby a student is administered only a sample of the assessment blocks (two mathematics and two science blocks) most items are missing by design for each student. However, missing data can also result from a student not answering an item, which can occur when the student does not know the answer, omits the item by mistake, or does not have sufficient time to attempt the item. An item is considered "not reached" whenwithin part 1 or part 2 of a booklet ${ }^{3}$ —the item itself and the item immediately preceding it are not answered, and there are no other items completed in the remainder of that part of the booklet.

[^9]Not-reached items are treated differently in estimating item parameters and in generating student proficiency scores. In estimating the values of the item parameters, items in the assessment booklets that are considered not to have been reached by students are treated as if they have not been administered. This approach is considered optimal for parameter estimation. However, notreached items are always considered as incorrect responses when student proficiency scores are generated.

## Evaluating Fit of IRT Models to the TIMSS Assessment Data

After the item calibrations were completed, checks were performed to verify that the item parameters obtained from Parscale adequately reproduce the observed distribution of student responses across the proficiency continuum. The fit of the IRT models to the TIMSS assessment data is examined by comparing the item response function curves generated using the item parameters estimated from the data with the empirical item response functions calculated from the latent abilities estimated for each student that responded to the item. When the empirical results for an item fall near the fitted curves, the IRT model fits the data well and provides an accurate and reliable measurement of the underlying proficiency scale. Graphical plots of these response function curves are called item characteristic curves (ICC).

The plots in the Exhibits 13.8 and 13.9 show examples of the empirical and fitted item response functions for dichotomously scored (right/wrong) multiple-choice and constructed response items, respectively. In each plot, the horizontal axis represents the proficiency scale, and the vertical axis represents the probability of a correct response. The fitted curve based on the estimated item parameters is shown as a solid line. Empirical results are represented by circles. The empirical results are obtained by first dividing the proficiency scale into intervals of equal size and then counting the number of students responding to the item whose estimated latent abilities (EAP scores) from Parscale fall in each interval. Then the proportion of students in each interval that responded correctly to the item is calculated. In the exhibits, the center of each circle represents this empirical proportion of correct responses. The size of each circle is proportional to the number of students contributing to the estimation of the empirical proportion correct.

Exhibit 13.8: Example of Item Response Function for a Dichotomous Multiple-Choice Item from the TIMSS 2015 Fourth Grade Mathematics Assessment

Exhibit 13.9: Example of Item Response Function for a Dichotomous Constructed Response Item from the TIMSS 2015 Eighth Grade Science Assessment

The plot in Exhibit 13.10 shows the empirical and fitted item response functions for a polytomous item (scored 0,1 , or 2 ). As for the dichotomous item plots, the horizontal axis represents the proficiency scale, but in this example the vertical axis represents the probability of having a response in a given response category. The fitted curves based on the estimated item parameters are shown as solid lines and again the empirical results are represented by circles. The interpretation of the circles is the same as in Exhibits 13.8 and 13.9. The curve starting at the top left of the chart plots the probability of a score of zero on the item. This probability decreases as proficiency increases. The bell-shaped curve shows the probability of a score of one point-partial credit, starting low for low-ability students, reaching a maximum for medium-ability students, and decreasing for high-ability students. The curve ending at the top right corner of the chart shows the probability of a score of two points—full credit, starting low for low-ability students and increasing as proficiency increases.

Exhibit 13.10: Example of Item Response Function for a Polytomous Constructed Response Item from the TIMSS 2015 Fourth Grade Science Assessment

## Variables for Conditioning the TIMSS Assessment Data

Conditioning is the practice of using all available students' background information to improve the reliability of the estimated student proficiency scores. Ideally all background data would be included in the conditioning model, but because TIMSS has so many student background variables that could be used in conditioning, the TIMSS \& PIRLS International Study Center follows the practice established by NAEP and followed by other large-scale studies of using principal components analysis to reduce the number of variables while explaining most of their common variance. Principal components for the TIMSS student background variables (including parent background variables at the fourth grade) were constructed as follows:

- For categorical variables (questions with a small number of fixed response options), a dummy coded variable was created for each response option, with a value of one if the option is chosen and zero otherwise. If a student omitted or was not administered
a particular question, all dummy coded variables associated with that question were assigned the value zero.
- Background variables with numerous response options (such as year of birth) were recoded using criterion scaling. ${ }^{4}$ This was done by replacing the response option with the mean interim achievement score of all students choosing that option. Criterion scaling maximizes the correlation between the scaled variable and achievement. For TIMSS, the interim achievement score was the average of the mathematics and science EAP scores produced from the item calibrations.
- Separately for each country, all the dummy-coded and criterion-scaled variables were included in a principal components analysis. Those principal components accounting for 90 percent of the variance of the background variables were retained for use as conditioning variables. ${ }^{5}$ Because the principal components analysis was performed separately for each country, different numbers of principal components were required to account for $90 \%$ of the common variance in each country's background variables.

In addition to the principal components, student gender (dummy coded), the language of the test (dummy coded), an indicator of the classroom in the school to which a student belongs (criterion scaled), and an optional country-specific variable (dummy coded) were included as primary conditioning variables, thereby accounting for most of the variance between students and preserving the between-classroom and within-classroom variance structure in the scaling model. For information on principal components conditioning, readers are referred to Exhibits 13.11 and 13.12, which provide details on the conditioning models used for proficiency estimation at the fourth and eighth grades, respectively.

## Generating IRT Proficiency Scores for the TIMSS Assessment Data

Educational Testing Service's MGROUP program (Sheehan, 1985) was used to generate the IRT proficiency scores. This program takes as input the students' responses to the items they were given, the item parameters estimated at the calibration stage, and the conditioning variables, and generates as output the plausible values that represent student proficiency. A useful feature of MGROUP is its ability to perform multi-dimensional scaling using the responses to all items across the proficiency scales and the correlations among the scales to improve the reliability of each individual scale. TIMSS capitalizes on this feature to simultaneously estimate overall mathematics and overall science proficiency using a two-dimensional MGROUP run.

The multi-dimensional scaling feature of MGROUP also was used to generate proficiency scores for the TIMSS 2015 content and cognitive domains. The estimation of proficiency scores for the mathematics and science content and cognitive domains relied on multidimensional IRT models using the item parameters estimated for the overall mathematics and overall science scales as well the same conditioning variables. At the fourth grade, the content domain scaling used two three-dimensional models, one to estimate proficiency scores for the three content domains in mathematics and a second for the three science content domains. At the eighth grade, the content
domain scaling required two four-dimensional models because of the four content domains in each subject. The cognitive domain scaling relied on four three-dimensional models to estimate the three cognitive domains in mathematics and science at both fourth and eighth grades.

In addition to generating plausible values on the overall mathematics and science scales for the 2015 assessment data, the item parameters estimated at the calibration stage also were used to generate plausible values for the TIMSS 2011 assessment for the countries included in the concurrent calibration at the fourth and eighth grades. These additional plausible values were used to establish the linear transformation necessary to place the 2015 assessment data on the appropriate trend scales.

## Transforming the Overall Scores to Measure Trends

To provide results for the TIMSS 2015 assessments on the existing TIMSS achievement scales, the 2015 proficiency scores (plausible values) for overall mathematics and overall science had to be transformed to the TIMSS reporting metric. This was accomplished through a set of linear transformations as part of the concurrent calibration approach. These linear transformations were given by:

$$
P V_{k, i}^{*}=A_{k, i}+B_{k, i} \times P V_{k, i}
$$

where
$P V_{k, i}$ is the TIMSS 2015 plausible value $i$ of scale $k$ prior to transformation; $P V_{k, i}^{*}$ is the TIMSS 2015 plausible value $i$ of scale $k$ after transformation; and $A_{k, i}$ and $B_{k, i}$ are the linear transformation constants.

The linear transformation constants were obtained by first computing the international means and standard deviations of the proficiency scores for the overall mathematics and science scales using the plausible values produced in 2011 based on the 2011 item calibrations for the trend countries. These were the plausible values published in 2011. Next, the same calculations were done using the plausible values from the re-scaled TIMSS 2011 assessment data based on the 2015 concurrent item calibrations for the same set of countries. From these calculations, the linear transformation constants were defined as:

$$
\begin{gathered}
B_{k, i}=\sigma_{k, i} / \sigma_{k, i}^{*} \\
A_{k, i}=\mu_{k, i}-B_{k, i} \cdot \mu_{k, i}^{*}
\end{gathered}
$$

where
$\mu_{k, i}$ is the international mean of scale $k$ based on plausible value $i$ published in 2011;
$\mu_{k, i}^{*}$ is the international mean of scale $k$ based on plausible value $i$ from the 2011 assessment based on the 2015 concurrent calibration;
$\sigma_{k, i}$ is the international standard deviation of scale $k$ based on plausible value $i$ published in 2011;
$\sigma_{k, i}^{*}$ is the international standard deviation of scale $k$ based on plausible value $i$ from the 2011 assessment based on the 2015 concurrent calibration.

There are five sets of transformation constants for each scale, one for each plausible value. The trend countries contributed equally in the calculation of these transformation constants. Exhibits 13.13 and 13.14 show the TIMSS 2015 transformation constants for both subjects at the fourth grade and eighth grade, respectively.

These linear transformation constants were applied to the overall proficiency scoresmathematics and science-at both grades and for all participating countries and benchmarking participants. This provided student achievement scores for the TIMSS 2015 assessments that are directly comparable to the scores from all previous assessments.

The linear transformation constants for the overall scales also were applied to the scales for the content and cognitive domains. The transformation constants for mathematics were applied to the proficiency scores of the mathematics content domains and cognitive domains, and the transformation constants for science were applied to the proficiency scores of the science content domains and cognitive domains. In this approach to measuring trends in content and cognitive domains, achievement changes over time are established in the context of achievement in each subject overall. Trends are not established separately for each content or cognitive domain; rather differential changes in performance in the domains are considered in the light of trends in the subject overall.

## Scaling the TIMSS Numeracy 2015 Achievement Data

TIMSS Numeracy was introduced in 2015 to assess the fundamental mathematical knowledge, procedures, and problem-solving strategies that are prerequisites for success on TIMSS mathematics at the fourth grade. TIMSS Numeracy asks students to answer questions and work problems similar to TIMSS mathematics at the fourth grade, with easier numbers and more straightforward procedures.

The TIMSS Numeracy assessment was designed to allow the mathematics achievement of participating countries to be reported on the TIMSS fourth grade mathematics trend scale. To that end, two of the TIMSS fourth grade item blocks were included in the TIMSS Numeracy assessment, along with eight mathematics item blocks dedicated to TIMSS Numeracy. The two shared TIMSS item blocks provided the link to place TIMSS Numeracy achievement on the TIMSS fourth grade mathematics scale. Exhibit 13.15 shows the number of items present in the TIMSS Numeracy 2015 assessment by item type and domain. There was a total of 124 items in the Numeracy assessment, 22 of them from the TIMSS fourth grade mathematics assessment.

Exhibit 13.15: TIMSS Numeracy 2015 Items for Calibration

| Item Type | Points | TIMSS Items |  | Numeracy Items |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Geometric Shapes and Measures | 7 | 7 | 24 | 9 | 31 | 16 |
| Data Display | 2 | 2 | 10 | 3 | 12 | 5 |
| Mathematics Cognitive Domains | TIMSS Items |  | Numeracy Items |  | Total |  |
|  | Items | Points | Items | Points | Items | Points |
| Knowing | 7 | 8 | 55 | 55 | 62 | 63 |
| Applying | 10 | 10 | 35 | 36 | 45 | 46 |
| Reasoning | 5 | 6 | 12 | 15 | 17 | 21 |
| Total | 22 | 24 | 102 | 106 | 124 | 130 |

Much like the normal TIMSS scaling procedure, the TIMSS Numeracy scaling approach involved the same four tasks of calibrating the achievement items, creating principal components for conditioning, generating proficiency scores, and placing these proficiency scores on the TIMSS fourth grade mathematics reporting scale. Exhibit 13.16 shows the sample sizes for scaling the TIMSS Numeracy data. A total of seven countries participated, as well as one benchmarking participant.

Exhibit 13.16: TIMSS Numeracy 2015 Sample Sizes for Scaling

| Country | Item <br> Calibration | Proficiency <br> Estimation |
| :--- | :---: | :---: |
| Bahrain | 4,429 | 4,429 |
| Indonesia | 4,294 | 4,294 |
| Iran, Islamic Rep. of | 4,105 | 4,105 |
| Jordan | 7,861 | 7,861 |
| Kuwait | 3,703 | 3,703 |
| Morocco | 5,360 | 5,360 |
| South Africa (5) | 10,932 | 10,932 |
| Benchmarking Participants |  |  |
| Buenos Aires, Argentina | - | 3,331 |
| Total | 40,684 | 44,015 |

The item calibration step was based on a straightforward calibration of the TIMSS Numeracy 2015 achievement items from the seven participating countries. The item parameters for the TIMSS Numeracy items were placed on the TIMSS fourth grade mathematics metric by fixing the parameters of the items in the two shared TIMSS 2015 item blocks to the values estimated from the TIMSS 2015 concurrent calibration. The two shared item blocks consisted of 22 items, 21 of which were used for linking the TIMSS Numeracy assessment to the TIMSS fourth grade mathematics assessment. One item—N04_08A (M061265A)—did not behave the same across both assessments and had its item parameters re-estimated as part of the TIMSS Numeracy item calibration. The item parameters estimated from the TIMSS Numeracy item calibration are presented in Appendix 13E. The 21 link items, whose item parameters were fixed, are marked with asterisks.

The conditioning for TIMSS Numeracy was done in exactly the same way as for TIMSS, as was the estimation of proficiency scores using the MGROUP software. This included overall mathematics scores for the TIMSS Numeracy countries and scores for the TIMSS fourth grade mathematics content and cognitive domains. Exhibit 13.17 provides details on the conditioning models used for the TIMSS Numeracy proficiency estimation.

Exhibit 13.17: TIMSS Numeracy 2015 Mathematics Conditioning Models for Proficiency Estimation

| Country | 2015 |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Number <br> of Primary <br> Conditioning <br> Variables | Number of <br> Principal <br> Components <br> Available | Number of <br> Principal <br> Components <br> Retained | Percentage <br> of Variance <br> Explained |
| Bahrain | 3 | 637 | 221 | 77 |
| Indonesia | 2 | 617 | 214 | 76 |
| Iran, Islamic Rep. of | 2 | 637 | 205 | 75 |
| Jordan | 2 | 637 | 334 | 90 |
| Kuwait | 3 | 629 | 185 | 72 |
| Morocco | 2 | 637 | 268 | 82 |
| South Africa (5) | 3 | 533 | 301 | 90 |
| Benchmarking Participants |  |  |  | 78 |
| Buenos Aires, Argentina | 2 | 620 | 166 | 78 |

The final step in the process consisted of placing students' performance on the TIMSS Numeracy 2015 assessment on the TIMSS fourth grade mathematics reporting scale. This was done by applying the appropriate linear transformation to the estimated proficiency scores. The TIMSS Numeracy item calibration resulted in item parameters on the same metric as the TIMSS fourth grade mathematics metric-by fixing the parameters of the 21 link items. Thus, placing the TIMSS Numeracy achievement scores on the TIMSS fourth grade mathematics scale was accomplished by using the TIMSS fourth grade mathematics linear transformation constants, as presented in Exhibit 13.13. These linear transformation constants were applied to the overall mathematics achievement scores, as well as the achievement scores on the content and cognitive domains.

## CHAPTER 14

## Using Scale Anchoring to Interpret the TIMSS 2015 Achievement Scales

> Ina V.S. Mullis

## Introduction

As described in Chapter 13: Scaling the TIMSS 2015 Achievement Data, the TIMSS 2015 achievement results are summarized using item response theory (IRT) scaling and reported on 0 to 1,000 achievement scales, with most achievement scores ranging from 300 to 700 . Countries' average scores provide users of the data with information about how achievement compares among countries and whether scores are improving or declining over time.

To provide as much information as possible for policy and curriculum reform, however, it is important to understand the mathematics and science competencies associated with different locations within the range of scores on the achievement scales. For example, in terms of levels of student understanding, what does it mean for a country to have average achievement of 513 or 426, and how are these scores different?

The TIMSS 2015 International Benchmarks provide information about what students know and can do at different points along the achievement scales. More specifically, TIMSS has identified four points along the achievement scales to use as international benchmarks of achievementAdvanced International Benchmark (625), High International Benchmark (550), Intermediate International Benchmark (475), and Low International Benchmark (400). For each assessment, the TIMSS \& PIRLS International Study Center works with the expert international committee, Science and Mathematics Item Review Committee (SMIRC), to conduct a scale anchoring analysis to describe student competencies at the benchmarks.

This chapter describes the scale anchoring procedures that were applied to describe student performance at the international benchmarks for TIMSS 2015. The analysis was conducted separately for mathematics and for science at fourth and eighth grades. In brief, scale anchoring
involved identifying items that students scoring at the international benchmarks answered correctly, and then having experts examine the content of each item to determine the kind of knowledge, skill, or reasoning demonstrated by students who responded correctly to the item. The experts then summarized the detailed list of item competencies in a brief description of achievement at each international benchmark. Thus, the scale anchoring procedure yielded a content-referenced interpretation of the achievement results that can be considered in light of the TIMSS 2015 frameworks for assessing mathematics and science.

## Classifying the Items

As the first step, students scoring within 5 scale-score points of each benchmark (i.e., the benchmark point plus or minus 5) were identified for the benchmark analysis. This 10-point range provided an adequate sample of students scoring at the benchmark, and yet was small enough so that performance at one international benchmark was still distinguishable from the next. The score ranges around each international benchmark and the number of students scoring in each range are shown in Exhibit 14.1.

Exhibit 14.1: Range Around Each International Benchmark and Number of Students Within Each Range

|  | Low <br> $(400)$ | Intermediate <br> $(475)$ | High <br> $(550)$ | Advanced <br> $(625)$ |
| :--- | :---: | :---: | :---: | :---: |
| Range of Scale Scores | $395-405$ | $470-480$ | $545-555$ | $620-630$ |
| TIMSS Grade 4 Mathematics <br> (Includes Numeracy) | 6,209 | 10,218 | 11,078 | 5,546 |
| TIMSS Grade 4 Science | 4,021 | 8,717 | 11,554 | 5,421 |
| TIMSS Grade 8 Mathematics | 6,999 | 8,525 | 7,756 | 4,041 |
| TIMSS Grade 8 Science | 5,860 | 8,462 | 8,878 | 4,627 |

The second step involved computing the percentage of those students scoring in the range around each international benchmark that answered each item correctly. To compute these percentages, students in each country were weighted proportionally to the size of the student population in the country. For multiple-choice items and constructed response items worth 1 point, it was a straightforward matter of computing the percentage of students at each benchmark who answered each item correctly. For constructed response items scored for partial and full credit, percentages were computed for students receiving partial credit (1-point) as well as for students receiving full credit (2-points).

Third, the criteria described below were applied to identify the items that anchored at each benchmark. An important feature of the scale anchoring method is that it yields descriptions of the performance demonstrated by students reaching each of the international benchmarks on
the scales, and that the descriptions reflect demonstrably different accomplishments by students reaching each successively higher benchmark. Because the process entails the delineation of sets of items that students at each international benchmark are likely to answer correctly and that discriminate between one benchmark and the next, the criteria for identifying the items that anchor considers performance at more than one benchmark.

For multiple-choice items, 65 percent was used as the criterion for anchoring at each benchmark being analyzed, since students would be likely (about two thirds of the time) to answer the item correctly. A somewhat less strict criterion was used for the constructed response items, because students had much less scope for guessing. For constructed response items, the criterion of 50 percent was used for the benchmark without any discrimination criterion for the next lower benchmark. In addition, a criterion of less than 50 percent was used for the next lower benchmark, because with this response probability, students were more likely to have answered the item incorrectly than correctly.

Using a multiple-choice items as an example, the criteria for each benchmark are outlined below.

- A multiple-choice item anchored at the Low International Benchmark (400) if at least 65 percent of students scoring in the range answered the item correctly. Because this was the lowest benchmark described, there were no further criteria.
- A multiple-choice item anchored at the Intermediate International Benchmark (475) if at least 65 percent of students scoring in the range answered the item correctly, and less than 50 percent of students at the Low International Benchmark answered the item correctly.
- A multiple-choice item anchored at the High International Benchmark (550) if at least 65 percent of students scoring in the range answered the item correctly, and less than 50 percent of students at the Intermediate International Benchmark answered the item correctly.
- A multiple-choice item anchored at the Advanced International Benchmark (625) if at least 65 percent of students scoring in the range answered the item correctly, and less than 50 percent of students at the High International Benchmark answered the item correctly.

To include all of the multiple-choice items in the anchoring process and provide information about content domains and cognitive processes that might not otherwise have had many anchor items, the concept of items that "almost anchored" was introduced. These were items that met slightly less stringent criteria for being answered correctly. The criteria to identify multiple-choice items that "almost anchored" were that 60 to 65 percent of students scoring in the range answered the item correctly and less than 50 percent of students at the next lowest benchmark answered the
item correctly. To be completely inclusive for all items, items that met only the criterion that 60 to 65 percent of the students answered correctly (regardless of the performance of students at the next lower point) were also identified. The categories of items were mutually exclusive, and ensured that all of the items were available to inform the descriptions of student achievement at the anchor levels. A multiple-choice item was considered to be "too difficult" to anchor if less than 60 percent of students at the advanced benchmark answered the item correctly. A constructed response item was considered to be "too difficult" to anchor if less than 50 percent of students at the advanced benchmark answered the item correctly.

Exhibit 14.2 presents the number of TIMSS 2015 mathematics and science items that anchored at each international benchmark. A description of the items for mathematics at the fourth grade, science at the fourth grade, mathematics at the eighth grade, and science the eighth grade can be found in Appendix 14A, 14B, 14C, and 14D, respectively. It should be noted that a partial credit item can anchor twice, typically at a higher benchmark for full credit, and a lower benchmark for partial credit (but sometimes both anchored at the same level). Scale anchoring for the science items considered partial credit and full credit responses separately. Scale anchoring for mathematics used only the full credit anchoring results. For the mathematics scale anchoring at the fourth grade, TIMSS took advantage of data from the Numeracy assessment items in developing the descriptions for the Low and Intermediate Benchmarks.

Exhibit 14.2: Number of Items Anchoring and Almost Anchoring at Each International Benchmark

## Writing the Scale Anchoring Descriptions

The scale anchoring for TIMSS 2015 was conducted in the spring of 2016 at a four-day meeting in Seoul, South Korea. In preparation for review by SMIRC, staff at the TIMSS \& PIRLS International Study Center used examples from previous assessments to draft short descriptions of the student competencies demonstrated by a correct (or partially correct) response to each mathematics and science item. Then, the mathematics and science items were organized separately by grade, grouped by international benchmark, and within each benchmark the items were sorted by content area. The final categorization was by the anchoring criteria the items met-items that anchored, followed by items that almost anchored, then by items that met only the 60 to 65 percent criteria. Also, in addition to the short draft descriptions, the following information was included for each item: framework classification, answer key or scoring guide, secure status, percent correct at each benchmark, and overall international percent correct.

At the scale anchoring meetings, the expert committees 1) worked through each item to finalize the description of the student competencies demonstrated by a correct (or a partially correct) response, 2) summarized the proficiency demonstrated by students reaching each international benchmark for publication in reports, and 3) selected example items that supported and illustrated the benchmark descriptions to publish together with the descriptions.

Following the scale anchoring meeting, the descriptions and example items published in the TIMSS 2015 reports were reviewed by National Research Coordinators at their $8^{\text {th }}$ meeting in Quebec City, Canada.

## Appendix 14A: TIMSS 2015 Fourth Grade Mathematics Item Descriptions Developed During the TIMSS 2015 Benchmarking

| Items at Low International Benchmark (400) |  |
| :---: | :---: |
| Number |  |
| M01_01 | Identifies a four-digit number given in words |
| M04_01 | Adds a four-digit, three-digit, and two-digit number |
| M05_01 | Subtracts a three-digit number from another three-digit number |
| M07_01 | Identifies the rectangular representation for a unit fraction |
| N01_01 | Adds three three-digit numbers |
| N01_04 | Divides a two-digit number by a one-digit number |
| N01_05 | Generates the next value in a well-defined number pattern |
| N01_07 | Recognizes a unit fraction represented pictorially |
| N02_04 | Multiplies a three-digit number by a one-digit number |
| N02_05 | Identifies an expression that represents a situation |
| N03_01 | Adds two two-digit numbers |
| N05_01 | Identifies a four-digit number represented in words |
| N05_02 | Solves a two-step word problem involving subtraction of one- and two-digit numbers |
| N06_02 | Solves a word problem involving addition of two two-digit numbers |
| N06_08 | Recognizes a non-unit fraction represented pictorially |
| N07_01 | Solves a word problem involving multiplication of one- and two-digit numbers |
| N07_03 | Solves a word problem involving subtraction of a one-digit number from a three-digit number |
| N07_07 | Finds the missing value in an addition number sentence |
| N09_02 | Solves a word problem involving subtraction of a one-digit number from a two-digit number |
| N09_05 | Multiplies a one-digit number by a two-digit number |
| N10_01 | Orders four three-digit numbers |

| N10_03A | Identifies the largest of four three-digit numbers in context |
| :---: | :---: |
| N10_06 | Recognizes a unit fraction represented pictorially |
| N10_09 | Solves a word problem involving addition of three one-digit numbers |
| Geometric Shapes and Measures |  |
| M13_06B | Identifies a street perpendicular to a given street |
| N01_09 | Reads a ruler to find the length of an object |
| N01_10 | Identifies triangles |
| N02_11A | Identifies the tallest of four rectangular prisms represented pictorially |
| N02_11B | Identifies the greatest volume of four rectangular prisms represented pictorially |
| N03_10 | Determines the distance around a triangle given the side lengths |
| N05_09 | Identifies a shape with equal angles |
| N05_10 | Completes a rectangle on a square grid |
| N06_10 | Identifies a cube |
| N09_08 | Identifies a cylinder |
| Data Display |  |
| M01_12 | Identifies the largest increase shown in a bar graph |
| M05_12 | Completes a table from given information by counting |
| M06_11A | Reads data from a bar graph |
| N03_04A | Reads data from a bar graph |
| N03_04B | Compares data presented on a bar graph |
| N05_05A | Reads data from a table |
| N05_05B | Compares data presented in a table |
| N07_05 | Uses data from a table to complete a bar graph (2 of 2 points) |
| N09_04A | Reads data from a bar graph |

| Items at Intermediate International Benchmark (475) |  |
| :---: | :---: |
| Number |  |
| M01_02 | Solves a word problem involving multiplication of one-digit numbers |
| M02_06 | Generates the next term in a well-defined number pattern |
| M04_02 | Determines a four-digit number given the place values of the digits |
| M08_01 | Identifies a four-digit number given in expanded form |
| M08_07 | Identifies an expression that represents a situation |
| M09_01 | Adds a four-digit and a three-digit number |
| M10_02 | Divides a three-digit number by a one-digit number |
| M12_03 | Multiplies a one-digit number by a three-digit number |
| M12_06 | Determines the operation to complete a number sentence |
| M13_02 | Identifies the representation of a non-unit fraction |
| N01_03 | Solves a word problem involving multiplication of a one-digit number by 10 |
| N01_06 | Solves a two-step word problem involving subtraction and division |
| N01_12 | Solves a word problem involving addition of money |
| N02_01 | Identifies a four-digit number given the digits in two places |
| N02_02 | Solves a word problem involving addition of two- and three-digit numbers |
| N02_03 | Divides a two-digit number by a one-digit number with a remainder |
| N03_02 | Divides a two-digit number by a one-digit number |
| N03_07 | Solves a word problem involving addition of decimals |
| N03_11 | Solves a word problem involving addition of hours and minutes |
| N05_03 | Solves a word problem involving division of a two-digit number by a one-digit number |
| N05_04 | Identifies an expression that represents a situation |
| N05_12 | Solves a word problem involving addition of hours and minutes |
| N06_01 | Subtracts a two-digit number from a three-digit number |

| N06_03 | Solves a word problem involving multiplication of one- and two-digit numbers |
| :---: | :---: |
| N06_06 | Determines the missing number in a well-defined number pattern |
| N07_02 | Multiplies a one-digit number by a two-digit number |
| N07_04 | Writes a number between two two-digit numbers |
| N07_06 | Finds the missing term in an addition word problem |
| N09_01 | Subtracts a two-digit number from a three-digit number |
| N09_03 | Writes a four-digit number given the digits in two places |
| N09_06 | Solves a multi-step word problem involving multiplication and division with a remainder |
| N09_07 | Writes a fraction larger than a given unit fraction |
| N10_02 | Solves a word problem involving division of a two-digit number by a one-digit number |
| N10_03B | Justifies the greatest number if one of four numbers is increased by 100 |
| N10_05 | Solves a word problem involving subtraction of one- and two-digit numbers |
| Geometric Shapes and Measures |  |
| M01_06A | Identifies the shape made by connecting specified dots on a circle |
| M02_09 | Identifies a time when the hands of a clock form a right angle |
| M03_09 | Draws the reflection of a simple shape across a line |
| M04_08 | Finds the halfway point between two positions on a number line |
| M05_07 | Identifies a pair of parallel lines |
| M05_10 | Identifies a net of a cube |
| M09_08 | Identifies a shape with a right angle |
| M13_07 | Identifies the number of triangular faces in a given three-dimensional shape |
| N01_11 | Draws a rectangle with given dimensions on a square grid |
| N02_09 | Draws a right angle on a square grid given one side |
| N05_11 | Determines the number of unit cubes to fill a rectangular prism |
| N06_09 | Identifies the appropriate metric unit of measurement for an object |

| N06_11 | Determines the number of faces on a rectangular prism |
| :---: | :---: |
| N07_10 | Identifies a common shape inside another common shape |
| N09_09 | Identifies a triangle with given properties |
| N09_11 | Justifies which figure made of unit cubes has the larger volume |
| N10_08 | Writes the names of four common two-dimensional shapes |
| Data Display |  |
| M01_11 | Interprets information in a table to solve a problem |
| M02_10 | Reads data from a table |
| M07_12 | Recognizes which set of labels on a bar graph could show given information |
| M14_10A | Reads data from a graph |
| Items at High International Benchmark (550) |  |
| Number |  |
| M01_03 | Identifies multiples of a given number |
| M01_04 | Adds two two-place decimals |
| M01_05 | Follows a rule to complete a table |
| M02_01 | Divides a two-digit number by a one-digit number with a remainder |
| M02_02 | Provides numbers that round to specified conditions (2 of 2 points) |
| M02_03 | Analyzes place value conditions to identify a four-digit number |
| M03_01 | Subtracts a three-digit number from a four-digit number |
| M03_02 | Solves a word problem involving division of two-digit numbers with a remainder |
| M04_05 | Solves a word problem involving subtracting one-place decimals |
| M04_06 | Identifies an expression that represents a situation |
| M05_02 | Identifies the whole number closest to a given multiple of a hundred |
| M06_01 | Identifies an expression that represents a situation |
| M06_05 | Solves a multi-step problem involving two-place decimals and whole numbers |

| M07_02 | Uses knowledge of place value to solve a problem involving a five-digit number |
| :---: | :---: |
| M07_04 | Writes a fraction that represents a subset of a set of objects |
| M07_05 | Identifies the largest of a set of unit fractions |
| M08_02 | Multiplies a two-digit number by a two-digit number |
| M08_06 | Solves for a repeated missing number in a subtraction sentence |
| M09_02 | Identifies the number closest in size to a given four-digit number |
| M09_03 | Solves a word problem involving division |
| M09_04 | Solves a word problem involving addition of time |
| M10_01 | Classifies two- and three-digit numbers as even or odd |
| M10_04 | Solves a word problem involving non-unit fractions |
| M10_06 | Determines the operation to complete a number sentence with operations on both sides |
| M10_07 | Identifies an expression that represents a situation |
| M11_03 | Solves a word problem involving multiplication of two-digit numbers |
| M11_04 | Identifies a set of objects with a given fraction shaded |
| M11_05 | Solves a number sentence involving multiplication facts |
| M11_06 | Adds a whole number and a two-place decimal |
| M12_01 | Rounds a four-digit number to the thousands place |
| M12_02 | Identifies a number that satisfies two conditions of multiples |
| M12_04 | Solves a problem set in a novel situation involving addition and comparison of whole numbers and justifies the solution |
| M13_01 | Identifies the set of numbers having a given number as a factor |
| M13_04A | Solves a word problem involving rectangular representations of fractions |
| M13_04B | Solves a word problem involving rectangular representations of fractions |
| M13_05 | Follows a two-step rule to extend a number pattern |
| M14_02 | Determines whether three pairs of numbers follow a two-step rule |
| M14_03 | Identifies a true statement about two- and three-digit numbers |

| M14_05 | Solves for the missing number in a subtraction sentence |
| :---: | :---: |
| M14_07 | Follows a two-step rule to generate the next number in a pattern |
| Geometric Shapes and Measures |  |
| M01_06B | Draws a specified geometric shape by connecting dots on a circle |
| M01_06C | Draws a specified geometric shape by connecting dots on a circle |
| M01_07 | Identifies the number of edges of a solid shown in a picture |
| M01_08 | Determines the perimeter of a figure made of squares |
| M03_07 | Identifies a shape that can be made by combining two given shapes |
| M03_08 | Identifies a property common to two triangles |
| M04_09 | Identifies a solid given two faces |
| M05_08 | Uses knowledge about properties of rectangles to classify statements as true or false |
| M06_07 | Identifies a shape that has a line of symmetry |
| M06_09 | Identifies the stack of cubes with the largest volume |
| M06_10 | Given a starting position on a map, follows specified moves and provides final coordinates |
| M07_07 | Identifies a pair of shapes which are not mirror images of each other |
| M08_09 | Finds the distance between two positions on a number line |
| M08_10 | Relates a specified face of a cube to its net |
| M09_11 | Solves a problem by filling a three-dimensional shape with rectangular solids |
| M10_09 | Recognizes acute angles in an irregular quadrilateral |
| M11_08 | Given a line, draws another line to form an angle less than a right angle |
| M11_09 | Identifies the two-dimensional view of a three-dimensional object |
| M12_08 | Classifies angle types in a figure |
| M14_08 | Draws an obtuse angle on a square grid given one side |
| M14_09 | Identifies a two-dimensional view of an irregular three-dimensional figure |

## Data Display

| M03_11 | Compares information in a table and a bar graph to solve a problem |
| :--- | :--- |
| M03_12 | Interprets data from a pie chart to solve a problem |
| M05_13 | Completes a bar graph from information given in a tally chart (2 of 2 points) |
| M06_11B | Uses information from a bar graph to solve a problem |
| M07_11 | Interprets a bar graph to solve a problem |
| M07_13A | Completes a bar graph using information from a pictograph |
| M09_12 | Identifies a pie chart that represents given data |
| M10_11 | Uses information from a bar graph to solve a problem |
| M11_11 | Identifies a pie chart that has the same information as a bar graph |
| M11_12 | Uses a key to retrieve data from a pictograph |
| M12_11A | Identifies the greatest value in a bar graph |
| M13_09A | Extrapolates from a graph to solve a problem |
| M14_10B |  |

Items at Advanced International Benchmark (625)

## Number

| M02_04 | Solves a multi-step reasoning problem involving division |
| :--- | :--- |
| M02_05 | Identifies the missing number in a number sentence with addition on both sides |
| M03_03 | Solves a word problem involving subtraction of time |
| M03_05 | Solves a multi-step problem involving two-place decimals and whole numbers |
| M03_06 | Identifies a term in a repeating pictorial pattern using division with a remainder |
| M04_03 | Devises two ways to allocate money in a given context (2 of 2 points) |
| M04_04 | Determines the missing digit for a two-digit number that satisfies two conditions |
| M04_07 | Identifies the missing number in a number sentence with operations on both sides |
| M05_03 | Identifies the smallest number from a set of one- and two-place decimals |

| M05_04A | Identifies the circular representation of a non-unit fraction |
| :---: | :---: |
| M05_04B | Explains why a chosen circular representation shows a given non-unit fraction |
| M05_05 | Identifies the missing first number in a number sentence involving subtraction |
| M05_06 | Identifies the two-step rule that relates the numbers in two columns of a table |
| M06_02 | Identifies the closest estimate to the result of a subtraction involving a five-digit number |
| M06_03 | Given four different digits, writes two two-digit numbers with the largest sum |
| M06_04 | Identifies a two-place decimal on a number line marked with one-place decimals |
| M06_06 | Solves a multi-step reasoning problem involving place value of whole numbers |
| M07_03 | Estimates the quotient of a four-digit number divided by a two-digit number |
| M07_06 | Solves a word problem involving proportional reasoning |
| M08_03 | Solves a multi-step word problem involving addition and subtraction of two- and three-digit numbers |
| M08_04 | Solves a problem to identify a fraction that represents the shaded portion of a figure |
| M08_05 | Solves a word problem involving division with a remainder and justifies the solution (2 of 2 points) |
| M09_05 | Identifies a fraction equivalent to a given fraction |
| M10_03 | Devises two ways of grouping objects that satisfy two conditions (2 of 2 points) |
| M10_05 | Draws a complete shape on a grid given a picture of a fraction of the shape |
| M11_01 | Solves a multi-step word problem involving multiplication and addition of whole numbers |
| M11_02 | Identifies a fraction equivalent to a one place decimal |
| M12_05 | Solves a word problem involving adding fractions with different denominators |
| M12_07 | Identifies a number sentence that represents a situation |
| M13_03 | Solves a multi-step problem involving division and gives a reason for their answer |
| M14_01 | Recognizes equivalent three-digit numbers written in expanded form |
| M14_04 | Identifies a number between a one-place decimal and two-place decimal |
| M14_06 | Identifies an expression that represents a situation |

| Geometric Shapes and Measures |  |
| :---: | :---: |
| M01_10 | Draws all four lines of symmetry on a non-standard shape (2 of 2 points) |
| M02_07 | Estimates the total length of a curved path given the length of a part of it |
| M02_08A | Given a description of a movement on a number line, determines another possible ending position |
| M02_08B | Given a starting point and two movements on a number line, identifies a possible ending position |
| M03_10 | Finds the perimeter of a given figure made of a square and a rectangle |
| M04_10A | Draws a parallel line on a square grid given conditions |
| M04_10B | Draws a perpendicular line on a square grid given conditions |
| M05_09 | Solves a multi-step word problem involving perimeter |
| M05_11 | Identifies the area of a right triangle drawn on a grid |
| M06_08 | Selects an appropriate unit of length to use in three different contexts |
| M07_08 | Determines the number of cubes in a given rectangular box |
| M07_10 | Draws a line through a given point perpendicular to a given line |
| M08_08 | Identifies parallel lines on a geometric shape |
| M09_07 | Identifies a rule to sort shapes into two sets |
| M09_09 | Identifies a shape that has both line and rotational symmetry |
| M09_10 | Determines the length of one side of an equilateral triangle and finds its perimeter |
| M10_08 | Reads a ruler to find the length of a line segment beginning and ending at half-units |
| M10_10 | Determines the number of square and triangular faces of three-dimensional shapes (2 of 2 points) |
| M11_07 | Reads a ruler to find the length of an object beginning at a half-unit |
| M11_10 | Finds the area of a rectangle given its dimensions |
| M12_09 | Given two positions on a curved path, follows specified moves and labels another position (2 of 2 points) |
| M12_10 | Identifies a net of a hexagonal prism |
| M13_06A | Identifies a street parallel to a given street |

## Data Display

| M07_13B | Draws and justifies a conclusion from data given in a table |
| :--- | :--- |
| M08_11 | Represents data from a table in a pie chart |
| M12_11B | Uses information in a pictograph to solve a problem |
| M13_09B | Interprets a bar graph to solve a two-step problem |
| Items Above the Advanced International Benchmark (625) |  |
| Number | Solves a non-routine problem presented pictorially (2 of 2 points) |
| M03_04 | Solves a multi-step problem involving fractions |
| M09_06 | Estimates the length of a curved line in non-standard units |
| Geometric Shapes and Measures |  |
| M01_09 | Identifies the area of an isosceles triangle drawn on a grid |
| M07_09 | Identifies a net of a given object |
| M13_08 |  |

## Appendix 14B: TIMSS 2015 Fourth Grade Science Item Descriptions Developed During the TIMSS 2015 Benchmarking

| Items at Low International Benchmark (400) |  |
| :--- | :--- |
| Life Science |  |
| S02_01 | Identifies examples of animals that lay eggs |
| S03_01 | Recognizes the mammal from among four pictures of animals |
| S05_05 | States one thing necessary to maintain good physical health (1 of 2 points) |
| S07_01 | Recognizes a living thing that produces its own food (1 of 2 points) |
| S08_03 | Recognizes an animal that has a backbone by matching diagrams of animals to their ecosystems |
| S10_01 | States one way to avoid catching illness in a crowded space (1 of 2 points) |
| S14_02 | Analyzes a diagram to explain which flower will grow better |
| S14_03 |  |

## Physical Science

| S04_08 | Classifies materials as solids, liquids, or gases |
| :--- | :--- |
| S07_06 | Recognizes ice as the solid form of water |
| S08_06 | Identifies a way to sort objects containing metals |
| S10_06 | Recognizes the states of matter of three different materials |

Items at Intermediate International Benchmark (475)

## Life Science

| S01_01 | Recognizes the function of seeds |
| :--- | :--- |
| S01_02 | Recognizes that the body needs more oxygen during exercise |
| S01_06 | For four out of five human activities, identifies which have positive and which have negative <br> effects on the environment (1 of 2 points) |
| S01_11 | States one effect the Sun can have on unprotected skin |
| S02_04 | Recognizes a transportation method that produces the least air pollution |
| S04_01 | Recognizes why milk is important in a balanced diet |

| S04_02 | States two things that plants need from their environment to make their own food |
| :---: | :---: |
| S06_04 | Uses a list of living things in a desert ecosystem to complete a food chain |
| S06_05 | Identifies a benefit of washing hands before eating |
| S07_02 | Describes one way people can protect their teeth from decay, in addition to brushing |
| S08_05 | Describes how human heart rate changes during exercise |
| S10_04 | States two reasons why a plant will not survive by analyzing given conditions |
| S12_03 | Completes a diagram describing the stages in the life cycle of a flowering plant |
| S12_06 | Describes one way a polar bear's fur helps it survive (1 of 2 points) |
| S14_04 | Evaluates two diagrams to explain which environment is better for sharks |
| Physical Science |  |
| S01_07 | Identifies the direction of the force of Earth's gravity in a diagram |
| S02_08 | Identifies the source of heat that causes ice cubes to melt |
| S04_09 | Explains why one object requires more force to start its motion than another |
| S06_07 | Identifies a property of steel that makes it a better building material than wood |
| S12_10 | Identifies why a bulb will not light in a model of an electric circuit |
| S14_08 | Identifies the best material to complete a circuit |
| Earth Science |  |
| S03_10 | Recognizes what happens to water on a sidewalk when it disappears |
| S05_11 | States one planet other than Earth that orbits the Sun (1 of 2 points) |
| S05_11 | States two planets other than Earth that orbit the Sun (2 of 2 points) |
| S06_12 | Provides evidence for the existence of air inside a balloon |
| S09_10 | Matches each item in a list of Earth's landscape features to its description |

## Items at High International Benchmark (550)

| S12_04A | Interprets data from an investigation to recognize the best condition for growing plants |
| :---: | :---: |
| S12_05 | Relates factory pollution to its effect on farm fields |
| S13_01 | Recognizes that in mammals, a male and female of the same kind are needed to reproduce |
| S13_02 | Explains that germs can be transmitted even when people do not appear to be sick |
| S13_05 | Identifies a function of a plant's stalk by interpreting an observation from an investigation |
| Physical Science |  |
| S01_12 | Names a source of energy other than coal, oil, or natural gas that is used to produce electricity |
| S02_07 | Explains the function of a battery in an electric circuit |
| S02_10A | Recognizes which direction to apply a force to reverse the direction of a moving object |
| S03_08 | Given a list of five everyday objects, recognizes which ones conduct electricity |
| S05_09B | Evaluates between two methods which would dissolve a piece of candy faster |
| S06_08 | Recognizes from a list which are sources of energy and which are not |
| S06_10 | Explains how a sweater can keep a bottle of water cold |
| S07_04 | Identifies the cause of a shadow forming |
| S07_11 | From a diagram, identifies the orientation of the poles on two repelling magnets |
| S08_08 | Recognizes what happens to the water when a puddle of water on a metal tray becomes smaller |
| S08_10 | Explains why pressing a guitar string stops the sound |
| S09_07 | Describes a difference between ice and water in addition to their physical states |
| S09_09A | Identifies from a diagram how a shadow is formed |
| S11_06 | States a reason for the color change and surface roughening of a metal object over time |
| S11_08 | Gives a reason why two objects of the same shape and size travel different distances after a push |
| S11_09 | Using a model of a flashlight, identifies an object that can be used to complete an electrical connection |
| S12_09A | Explains why boiling decreases the amount of water in a container |
| S12_09B | Predicts the effect on a cold window glass of boiling water nearby |
| S13_07 | Observes that two metal bars repel and determines whether they are magnets |

| S13_08 | Explains that heat in a metal object reaches the nearest point soonest |
| :---: | :---: |
| S13_09 | Using a diagram, identifies which hidden object could complete an electric circuit |
| Earth Science |  |
| S01_08 | Recognizes evidence that there were many kinds of animals on Earth that no longer exist today |
| S03_11 | Identifies a conclusion scientists draw from fossils of shellfish found on land |
| S03_12 | Identifies a pictorial representation of a shadow at midday |
| S04_11 | Recognizes a diagram showing the correct relative positions of the Earth, Moon, and Sun |
| S04_12 | From pictures of rock formations, identifies how a given rock may have looked long ago |
| S05_12 | From a diagram showing a shadow at different times of the day, explains why the shadow changed |
| S06_11 | Recognizes that water flows from mountains to oceans via rivers |
| S07_13 | States one thing that makes up Earth's crust (1 of 2 points) |
| S07_14 | From a table showing temperature and cloud cover at different locations, identifies the place where is it most likely to snow |
| S08_11 | Using two pictures of the same location, explains that the Moon can look different at different times |
| S08_12 | Recognizes which step in a diagram of a water cycle shows evaporation |
| S10_10A | Interprets information from a graph to recognize which crops will grow best in an area with given precipitation |
| S11_11 | Recognizes a feature of the Moon from observations over a month |
| S12_02 | Recognizes seasons north and south of the Equator |
| S13_11 | Recognizes that the solar system is made up of the Sun and its planets |
| S14_12 | Interprets information from temperature graphs to identify which of two places has certain climate properties |
| Items at Advanced International Benchmark (625) |  |
| Life Science |  |
| S01_03 | Identifies examples of animals that take care of their young |
| S01_04 | Identifies how being poisonous to birds is an advantage for monarch butterflies |
| S02_03 | Recognizes a food with a high protein content |

| S02_05 | Explains how a flu-like disease can be transmitted through the air |
| :---: | :---: |
| S03_05 | Analyzes statements to identify possible characteristics of predators and prey |
| S04_03 | Identifies a reason that some mammals pant on hot days |
| S04_05 | Predicts the consequences of removing a predator from an animal's habitat |
| S05_02 | Recognizes the function of the flowering part of a plant |
| S05_06 | Recognizes an animal that is classified as a mammal |
| S06_02 | Describes two ways pollen is spread from flower to flower (2 of 2 points) |
| S07_07 | Explains why people should drink a lot of liquid every day |
| S07_09 | Identifies one physical change that can take place in a mammal as the weather gets colder |
| S10_03B | Uses a food web to determine which animals are competitors |
| S11_01 | Recognizes the function of muscles attached to bones |
| S11_04 | Evaluates three experimental designs and explains which is best to test if plants need light to grow |
| S11_05 | Draws a conclusion by relating one function of feathers to keeping a body warm in the case of dinosaurs |
| S12_04B | Identifies a conclusion about plant growth using data from an investigation |
| S12_06 | Describes two ways a polar bear's fur helps it survive (2 of 2 points) |
| S13_03A | Explains that to test the survival of plants, they should be compared under different conditions |
| S13_03B | Identifies a desert plant and describes one feature that helps it survive in the desert |
| S13_04 | States two things in addition to water that animals need to survive |
| S14_02 | States two ways to avoid catching an illness in a crowded space (2 of 2 points) |
| S14_05 | Describes how boiling water makes it safe to drink |
| Physical Science |  |
| S01_13 | Recognizes that burning results in new substances |
| S02_06 | Explains how the poles of two magnets should be oriented to cause repulsion |
| S02_09 | Recognizes a property of metals that makes them good electrical wires |
| S02_10B | Recognizes which direction to apply a force to change the direction of a moving object |

| S03_07 | Recognizes a property used to classify everyday objects into two groups |
| :---: | :---: |
| S03_09 | Names the force that moves an object down a sloping track |
| S04_07 | Predicts which of two objects is a better conductor of heat with supporting explanation |
| S04_10 | States one form of energy present in a model of an electric circuit (1 of 2 points) |
| S05_09A | Evaluates between two methods which would dissolve a piece of candy faster |
| S05_09C | Evaluates a list of methods and predicts which method produces a less sweet drink |
| S05_10 | Recognizes the best conductor of heat in a list of materials |
| S07_03 | Using information in a table, identifies another item whose physical properties match those of one of the items in the table |
| S08_07 | Analyzes a diagram to identify one way to make a shadow bigger |
| S09_08 | Identifies that the temperature at which an object melts depends on the material from which it is made |
| S09_09B | Recognizes that a shadow produced in colored light is black |
| S10_07 | Explains the process by which wet objects become dry |
| S10_08 | Explains how to separate a mixture of two types of solids of different sizes |
| S10_09A | Recognizes set-ups that will more quickly dissolve a solid in water |
| S10_09B | Explains the importance of controlling a variable in an experiment |
| S12_07 | Identifies a physical property of metal pot that makes it good for boiling water |
| S12_08A | Evaluates the best way to separate a mixture of solids of similar size |
| S12_08B | Evaluates the best way to separate a mixture of things that dissolve and things that do not dissolve |
| S13_06 | Identifies that two objects of the same size and shape have the same volume and, from a diagram, that they have different masses |
| S14_06 | Recognizes one property of a liquid |
| S14_07 | Evaluates the best set-up to investigate whether temperature affects the rate at which a solid dissolves in water |
| S14_09 | Recognizes a diagram that demonstrates motion due to gravity |
| Earth Science |  |
| S01_10 | Draws a conclusion from an investigation to explain why water does not fill a glass inverted in water, (referring to air in the glass) OR to explain why water does fill a glass when it is tilted (referring to air escaping) (1 of 2 points) |

| S07_12 | Recognizes how long it takes for Earth to orbit the Sun |
| :--- | :--- |
| S07_13 | States two things that make up Earth's crust (2 of 2 points) |
| S09_11 | Synthesizes precipitation information from a graph and diagram to recognize the best area to plant <br> a crop in a given climate |
| S10_10B | Identifies that clouds are made of water droplets <br> S11_10 <br> and night in a particular location |
| S11_12 | Recognizes which place is likely to have weather that is hot and wet |
| S13_10 | Identifies the diagram that shows relative amounts of water and land on the Earth's surface |

Items Above the Advanced International Benchmark (625)

| Life Science |  |
| :--- | :--- |
| S03_03 | Explains that the same type of plants should be compared when investigating plant growth with <br> or without fertilizer |
| S05_04 | From a list of plants and animals, identifies all of those that make their own food (2 of 2 points) <br> points) |
| S05_05 | Explains why laying a large number of eggs helps frogs survive in their environment <br> States two characteristics that a plant and an animal share, other than a need for water (2 of 2 |
| p06_03 | Recognizes a living thing that produces its own food and describes the process (2 of 2 points) |
| S08_03 | Identifies that more use of public transportation will decrease air pollution in a large city |
| S09_06 | Recognizes the main function of leaves on a plant |

## Physical Science

| S01_05 | Labels the freezing point of water on a diagram of a thermometer |
| :--- | :--- |
| S03_06 | Explains that cooking causes a change that cannot be reversed |
| S04_10 | States two forms of energy present in a model of an electric circuit (2 of 2 points) <br> to light |
| S05_08 | Explains why a metal spoon in hot soup feels hotter than a wooden spoon in hot soup |

TIMSS
2015

| Earth Science |  |
| :--- | :--- |
| S01_10 | In the context of an investigation, explains why water does not fill a glass inverted in water, <br> (referring to air in the glass) AND explains why water does fill a glass when it is tilted (referring to <br> air escaping) (2 of 2 points) |
| Recognizes how wind can cause weathering of rocks |  |
| S02_12 | Explains why stars are not visible during the day |
| S08_09 | States one source of energy other than sunlight that can be changed into electricity |
| S14_11 | Recognizes four true statements about recycling metals |

## Appendix 14C: TIMSS 2015 Eighth Grade Mathematics Item Descriptions Developed During the TIMSS 2015 Benchmarking

| Items at Low International Benchmark (400)  <br> Number  <br> M04_01 Recognizes a 7-digit number given in words <br> M07_01 Evaluates the power of a whole number <br> Data and Chance  <br> M01_13 Uses information in a table to complete a bar graph <br> M06_13 Identifies the table that matches the information shown in a pictograph |
| :--- | :--- |

Items at Intermediate International Benchmark (475)

| Number |  |
| :--- | :--- |
| M01_04 | Identifies equivalent ratios |
| M02_01 | Recognizes the commutative property |
| M03_01 | Identifies the decimal number closest in size to a given fraction |
| M05_01 | Identifies the divisor by moving the decimal point |
| M07_03 | Uses knowledge of the whole being 100 percent to solve a simple word problem |
| M07_04A | Completes a table of equivalent proportions |
| M08_04 | Shades a percent of a figure |
| M09_01 | Evaluates an expression involving negative whole numbers and parentheses |
| M09_02 | Solves a word problem involving subtraction of negative numbers |
| M10_01 | Solves a word problem involving subtraction of negative numbers |
| M11_03 | Solves a two-step word problem involving whole numbers |
| M11_04 | Determines what fraction of a 10×10 grid is shaded |
| M13_02A | Solves a word problem involving addition of time |

| Algebra |  |
| :---: | :---: |
| M11_06 | Evaluates the power of an expression given its value |
| M12_08 | Uses values for a linear function to determine an extrapolated value |
| M14_05 | Solves a linear equation in two-variables given the value of one variable |
| Geometry |  |
| M02_08 | Identifies opposite faces of a cube given its net |
| M04_09 | Recognizes congruent quadrilaterals |
| M05_12 | Identifies a true statement based on the properties of parallel and perpendicular lines |
| M12_09 | Identifies the reflection of a partly shaded shape |
| M12_11 | Determines the total number of stacked unit cubes |
| Data and Chance |  |
| M05_15 | Given a table of percentages, selects the pie chart that could represent the given data |
| M06_12A | Compares the chances of two outcomes shown pictorially |
| M07_12 | Reads values from two line graphs to solve a problem |
| M07_14 | Given a situation, judges the chance of an outcome as unlikely |
| M08_14A | Estimates an expected value given an observed sample |
| M09_12 | Finds and compares the unit prices of four objects |
| M09_14 | Identifies the bar graph that matches the information shown in a table |
| M11_12A | Reads data from a line graph |
| M11_12B | Compares data from two line graphs to solve a problem |
| M13_12 | Solves a problem given the chance of an outcome |
| Items at High International Benchmark (550) |  |
| Number |  |
| M01_01 | Solves a word problem involving multiplication of a fraction and a decimal |
| M01_06B | Selects and combines information from two sources to solve a multi-step word problem (2 of 2 points) |
| M02_02 | Solves a two-step word problem involving subtraction of whole numbers and multiplication of a fraction |

| M02_03A | Determines the percentage for a section of a pie chart |
| :---: | :---: |
| M03_04 | Orders decimals with different numbers of decimal places |
| M03_05 | Solves a proportion problem involving decimals |
| M05_02 | Recognizes the fraction equivalent to a percentage |
| M05_03 | Approximates the sum of five three-digit numbers to the nearest hundred |
| M05_04 | Identifies the larger of two fractions with different numerators and different denominators and explains why it is larger |
| M06_01 | Uses the distributive law to identify an expression equivalent to a given one |
| M06_04 | Determines fractions equivalent to a given fraction |
| M07_04B | Finds the unknown term in a proportion in a given situation |
| M08_01 | Identifies an expression equivalent to a given division expression |
| M08_03 | Finds the missing value in an addition problem with both fractions and decimals |
| M09_04 | Given the two parts of a whole in a word problem, identifies the fraction which represents one part |
| M09_05A | Solves a word problem involving multiplication and addition of whole numbers |
| M10_02 | Identifies equivalent ratios |
| M10_04 | Uses four different digits to write two two-digit numbers with the smallest product |
| M11_01 | Solves a word problem involving ratios |
| M11_02 | Identifies a prime number |
| M12_01 | Solves a word problem involving a fraction of a whole |
| M12_02 | Solves a word problem involving division of whole numbers with a remainder |
| M13_01 | Identifies the representation of a fraction equivalent to a given representation of a fraction |
| M13_03 | Understands a property of adding multiples |
| M13_04 | Writes a decimal with three places as a fraction |
| M14_01 | Identifies an expression equivalent to a given multiplicative expression |
| M14_02 | Solves a two-step word problem involving subtraction of whole numbers and multiplication of a fraction |
| M14_04 | Solves a word problem involving ratios and decimals |

| Algebra |  |
| :--- | :--- |
| M01_03 | Recognizes the distributive property in evaluating an algebraic expression |
| M01_05 | Identifies the algebraic expression that represents a fraction of a variable |
| M01_07 | Identifies the ordered pair of numbers that satisfies a given linear equation |
| M01_08 | Identifies the equation that models a situation given in a word problem |
| M01_09 | Identifies values of two variables, each satisfying a simple inequality |
| M03_06 | Evaluates an algebraic expression involving a fraction |
| M03_08 | Identifies the solution to an equation involving a square root |
| M03_09 | Identifies the formula that represents a situation involving area |
| M05_06 | Solves a simple linear equation in one variable with a mixed number solution |
| M05_07 | Finds a missing term in a non-arithmetic and non-geometric number sequence |
| M13_07A | Identifies the true statement about a linear relationship given in a graph |
| M12_07 | Identifies an expression for the area of part of a geometric figure |
| M12_06 | Identifies the linear equation satisfied by two given values |
| M05_11A | Adds two algebraic expressions and simplifies |
| M06_08A | Extends a pattern to find the area of a square |
| M05_07 | Finds the value of an algebraic expression involving parentheses and negative terms equivalent algebraic expression involving exponents and multiplication |
| M09_07 | Identifies an algebraic expression that represents the perimeter of an irregular shape |
| Identifies an expression that represents a situation |  |
| Evaluates an algebraic expression involving fractions and integers |  |
| Uses a given formula involving fractions to solve a word problem |  |

| Geometry |  |
| :---: | :---: |
| M01_11 | Identifies the number of remaining unit cubes |
| M02_07 | Draws the reflection of a shape over a diagonal line on a grid |
| M03_11 | Identifies a net of a rectangular solid |
| M03_12 | Solves a problem involving angles of a triangle and parallel lines |
| M05_13 | Uses the angle properties of triangles and rectangles to find a missing angle |
| M06_09 | Uses the Pythagorean theorem to solve a word problem |
| M06_10 | Solves a problem involving angles of a triangle |
| M07_09 | Draws a symmetrical shape given half of it and its line of symmetry |
| M08_10 | Finds the coordinates of a midpoint given two points in the Cartesian plane |
| M09_10 | Identifies the value of an angle involving properties of corresponding and supplementary angles |
| M09_11 | Draws an angle of a given measure on a square grid |
| M11_10 | Solves a problem involving similar triangles |
| M13_11 | Solves a problem involving angles of a triangle |
| M14_08A | Solves a word problem involving the length around a hexagonal prism |
| Data and Chance |  |
| M01_14 | Explains why a conclusion drawn from a given bar graph is incorrect |
| M02_13 | Identifies the probability of an event |
| M05_16 | Interpolates from a line graph to provide an estimated value |
| M06_12B | Compares the chances of two outcomes |
| M07_02 | Reads the value indicated by an unlabeled mark on a speedometer |
| M07_13 | Identifies a possible description of a part of a time-speed graph |
| M10_13A | Computes the mean of four given values |
| M11_13 | Interprets data in a pictograph to solve a multi-step problem |
| M11_14 | Justifies a conclusion resulting from comparing two distributions |

| M2. 13 |  |
| :---: | :---: |

| M13_02B | Solves a word problem involving percentages and elapsed time |
| :---: | :---: |
| M14_03 | Identifies a percentage using a given ratio |
| Algebra |  |
| M01_10 | Uses a given formula to solve a word problem |
| M02_04 | Solves a pair of simultaneous linear equations in two variables |
| M02_05 | Computes values of a function given values of the variable |
| M02_06 | Identifies a linear equation given the y -intercept |
| M04_05 | Simplifies an algebraic expression |
| M04_06 | Retrieves coordinate points from a graph of a function |
| M04_08 | Constructs a linear equation for the perimeter of a triangle and solves for the length of one side |
| M05_05 | Writes a rule for a multiplicative number pattern involving negative numbers |
| M05_09 | Solves a proportion expressed algebraically |
| M05_10 | Constructs and uses the solution of a linear equation to solve a word problem (2 of 2 points) |
| M05_11B | Subtracts one algebraic expression from another and simplifies |
| M06_06 | Identifies an equivalent equation |
| M06_07 | Identifies a pair of simultaneous linear equations that model a given situation |
| M07_05 | Identifies the equation of a line that passes through points shown on a graph |
| M07_06 | Identifies the equation that models a situation involving distance, speed, and time |
| M07_08A | Finds a specific term in a pattern presented numerically and geometrically |
| M07_08B | Explains how to find a specific term in a pattern presented numerically and geometrically |
| M07_08C | Expresses the general term algebraically in a pattern presented numerically and geometrically |
| M08_06 | Identifies a line with positive slope |
| M09_06 | Identifies an equivalent algebraic expression |
| M09_09 | Demonstrates an understanding of slope by relating graphs and their equations |
| M10_06 | Constructs a linear equation to represent a situation |

| M02_12 | Estimates probability given an observed sample |
| :---: | :---: |
| M03_13 | Explains why a data representation could be misleading |
| M03_14 | Interprets data in a pie chart to solve a word problem |
| M03_15 | Uses understanding of mean and range to solve a problem |
| M04_12A | Calculates mean and median for two ordered lists of data (2 of 2 points) |
| M08_14B | Compares observed and expected values |
| M10_12 | Estimates the number of objects in a given probability sample |
| M10_13B | Determines the change in a mean given changes in individual scores |
| M12_12 | Solves a word problem involving averages |
| M13_13A | Uses and interprets data sets in pie charts to solve a problem involving percentages |
| Items Above the Advanced International Benchmark (625) |  |
| Number |  |
| M01_06C | Compares results derived from two sources and provides a justification for the conclusion (2 of 2 points) |
| Algebra |  |
| M03_07 | Writes an expression for the area of part of a geometric figure |
| M04_07 | Determines a collinear point given another point on the line and the slope |
| M06_08B | Writes the algebraic expression for the nth term in a series |
| M08_05 | Identifies the equivalent form of a linear inequality in one variable |
| M11_07 | Identifies an algebraic expression involving parentheses and negative terms |
| M12_05 | Identifies equivalent rational expressions |
| Geometry |  |
| M02_10 | Explains how to find the area of an irregular shape on a grid (2 of 2 points) |
| M03_10 | Solves a word problem using properties of similar triangles |
| M04_11 | Explains why two shaded areas of overlapping congruent triangles are equal |
| M08_11 | Solves for a missing side length given two similar triangles |
| M11_09 | Draws all lines of symmetry on a regular polygon |

| M11_11 | Solves a multi-step word problem involving ratios between volumes |
| :--- | :--- |
| M13_09 | Identifies the image of a shape after rotation and reflection |
| M14_09 | Determines the number of exposed faces for unit-cubes that make up a larger cube (2 of 2 points) |
| M14_10 | Solves a word problem involving the Pythagorean theorem |
| Data and Chance |  |
| M04_13 | Solves a multi-step problem involving probability |
| M08_13 | Compares characteristics of two dot plots to justify a conclusion |
| M09_13 | Explains why a data representation could be misleading |

## Appendix 14D: TIMSS 2015 Eighth Grade Science Item Descriptions Developed During the TIMSS 2015 Benchmarking

| Items at Low International Benchmark (400) |  |
| :---: | :---: |
| Biology |  |
| S13_01 | States one reason why male penguins' incubation behavior helps their eggs survive (1 of 2 points) |
| S14_01A | Uses a food web to identify which organisms are producers |
| S14_01B | Uses a food web to identify which organisms eat only plants |
| Chemistry |  |
| S07_06 | Recognizes a material that best conducts both heat and electricity |
| Physics |  |
| S12_15 | Recognizes whether an electromagnet would attract objects made of various materials (1 of 2 points) |
| Earth Science |  |
| S03_12A | Using a diagram, identifies what moves water from an artesian basin to the surface |
| Items at Intermediate International Benchmark (475) |  |
| Biology |  |
| S02_03 | Explains the advantage for a species of mice to have color matching its environment |
| S03_02 | Matches 2 of 4 animal groups to their characteristic features (1 of 2 points) |
| S04_03 | Recognizes characteristics inherited by rabbits in a given context |
| S04_04 | Justifies an advantage of hollow bones for birds |
| S05_01 | Identifies how vaccination helps prevent illnesses |
| S05_05A | Interprets information in a table to describe how the populations of two organisms changed over time |
| S06_01 | Recognizes a living thing that has growth rings |
| S06_04 | Recognizes from a list of foods which is the best source of calcium |
| S06_05A | Identifies why fish eat mosquito larvae but not adult mosquitos |
| S07_01 | Recognizes an organism that is a producer |

| S07_05C | Identifies an advantage for a species of butterfly to resemble another species that is toxic to birds |
| :---: | :---: |
| S09_02 | Analyzes information about an ecosystem and explains the effect of introducing a new population |
| S09_03B | Reasons how a crocodile's angle of vision helps it to survive in the environment |
| S10_01 | Recognizes the process in the water cycle indicated in a diagram of an ecosystem |
| S10_02 | States one substance plants obtain from their environment and use in photosynthesis (1 of 2 points) |
| S11_01A | Recognizes the agent that causes influenza |
| S12_04 | Describes one characteristic of mammals that is advantageous for survival in cold weather (1 of 2 points) |
| S13_05 | For pairs of animals, distinguishes between predatory and competitive relationships |
| S14_04 | Recognizes the functions of 2 of 4 tissues found in the human stomach (1 of 2 points) |
| Chemistry |  |
| S07_04 | Uses information from an investigation to recognize the condition under which nails would rust most |
| S08_01 | Recognizes a chemical process that involves the absorption of light |
| S11_07 | Recognizes an everyday occurrence that is an example of a chemical change |
| S13_07 | Applies knowledge of concentration to explain why one solution is paler than another solution |
| Physics |  |
| S01_10A | Given a diagram showing a ball being thrown upwards, states the force that causes the ball to fall |
| S02_11 | Uses information in a graph to recognize the motion of an object at five time points |
| S03_11 | Recognizes the placement of a fulcrum that requires the least amount of force to move an object |
| S05_06 | Recognizes the form of energy in a compressed spring |
| S08_09 | Recognizes the type of energy change that occurs as a child slides down a slide |
| S14_06 | Relates knowledge of density to indicate the order in which three liquids will settle after being poured in a beaker |
| Earth Science |  |
| S02_01 | Recognizes whether 4 of 5 effects are a benefits of recycling paper (1 of 2 points) |
| S02_12 | Recognizes a possible result of Earth's continents moving |
| S02_13 | Describes one thing being done by car-makers to reduce air pollution (1 of 2 points) |

| S05_09 | Recognizes a gas that is increasing in Earth's atmosphere |
| :---: | :---: |
| S06_14 | Uses a diagram to state one advantage of a plant having roots that reach the subsoil (1 of 2 points) |
| S07_14 | Recognizes an effect of Earth rotating on its axis |
| S13_11A | Uses information in a table with characteristics of planets to identify the planet with the shortest day length |
| S13_12 | Recognizes the reason for cold temperatures outside an airplane in flight |
| S14_15 | Synthesizes information in rainfall and temperature graphs to match 2 of 4 animals with the climate where they live (1 of 2 points) |
| Items at High International Benchmark (550) |  |
| Biology |  |
| S01_02 | Classifies 6 of 7 animals into two groups, based on a stated physical or behavioral characteristic ( 1 of 2 points) |
| S01_04A | Indicates in a table which gas is released into the air and which gas is removed from the air during animal respiration |
| S01_04C | Indicates in a table which gas is released into the air and which gas is removed from the air during photosynthesis |
| S02_02 | Recognizes the group to which an animal belongs given some of its features |
| S02_04A | Predicts the change in the amounts of two gases in the air as a result of an experiment on photosynthesis |
| S02_04B | Identifies 1 of 2 factors other than light intensity that could affect the rate of photosynthesis in an investigation (1 of 2 points) |
| S04_01 | Recognizes what happens to an animal's cells as it grows |
| S04_02 | Recognizes 2 of 3 major organs in a diagram (1 of 2 points) |
| S05_02 | Explains why birds of prey cannot survive in an environment without plants |
| S05_05B | Draws a conclusion from population data in a table and gives a possible explanation for a change in population |
| S06_02 | Identifies why birds puff up their feathers in cold weather |
| S06_06 | Identifies parts of the human body as organ systems |
| S08_05 | Selects and classifies 3 of 4 foods from a list that comprise a balanced diet (1 of 2 points) |
| S08_06A | Evaluates data from a table to draw a conclusion about the reason for a change in population of a species |
| S09_01 | Recognizes which food is the best source of carbohydrates |
| S10_03 | Recognizes why rabbits inherit traits that their parents do not have |

| S10_04A | Identifies one way that plant and animal cells are similar (1 of 2 points) |
| :---: | :---: |
| S11_02 | Interprets a diagram to identify what happens to biceps and triceps when an elbow bends |
| S11_03 | Recognizes a human characteristic that is acquired |
| S11_04 | Explains how flooding leads to a shortage of drinking water or the spread of disease (1 of 2 points) |
| S12_01 | Recognizes a list of food that comprises a healthy, balanced meal |
| S12_02 | Explains why it is unlikely for someone to get sick with the measles a second time |
| S12_03 | Identifies the conclusion best supported by a diagram of rock layers with embedded fossils |
| S12_04 | Describes two characteristics of mammals that are advantageous for survival in cold weather (2 of 2 points) |
| S13_02 | Recognizes an organism that is made up of cells with cell walls |
| S13_03 | Recognizes how decomposers get their energy |
| S13_04 | Given a food chain, explains which organism competes most with humans in a farming community |
| S14_02 | Explains how a fossil can be classified as plant or animal, based on its cellular structure |
| S14_03 | Predicts how heart rate changes in response to exercise, based on a set of given conditions |
| Chemistry |  |
| S03_05 | Recognizes a property of most nonmetals |
| S05_08B | In the context of an investigation about the gold content of jewelry, selects information from a table of properties of gold alloys to complete a table relating the density of alloys to number of carats and percentage of gold in each piece of jewelry |
| S05_08C | In the context of an investigation about the gold content of jewelry, uses previously selected information and follows an example to calculate the mass of gold in jewelry |
| S06_07 | From a table of melting and boiling points of three substances, identifies the state of each substance at a given temperature |
| S06_08 | Given two proposed methods for separating a mixture of small pieces of two metals, identifies which method will work or why the other method will not work (1 of 2 points) |
| S06_09 | Recognizes an everyday activity that is a chemical process that releases energy |
| S07_08 | Identifies and explains which solution is more dilute than another in a given context |
| S08_02 | Recognizes a model of a carbon dioxide molecule |
| S09_06 | Recognizes and explains which substance will float on water using a table of densities |
| S09_08 | Recognizes which process makes bronze dark and dull over time |

| S10_10 | Recognizes which model best illustrates the results of a chemical reaction |
| :---: | :---: |
| S11_05 | From a list of symbols and formulas, recognizes which are elements and which are compounds |
| S11_10 | Explains the effect of temperature on diffusion in the context of an investigation |
| S12_06 | Identifies the number of atoms of each element in nitric acid |
| S12_07 | Use data in a table to order set-ups according to the rate at which a solute will dissolve in water |
| S14_11 | Explains whether a reaction between two solutions in a given context can occur a second time |
| Physics |  |
| S01_07 | Recognizes the pathway of light required for an object to be seen |
| S01_08 | Recognizes an everyday object most likely to be used as a lever |
| S02_09 | Explains whether a conclusion can be made about the relative strengths of two magnets in a given context |
| S04_05 | Relates knowledge of heat transfer to recognize a graph that shows how two substances eventually reach temperature equilibrium |
| S05_12 | Explains that there are forces acting on students sitting on a wall |
| S06_10 | Recognizes the orientation of a hidden mirror given rays of light reflecting |
| S07_07 | Uses a table showing the speed of sound through different media and knowledge of the state of each medium to recognize a conclusion that may be drawn about the relative speed of sound |
| S07_09 | Recognizes why a helium balloon rises into the air |
| S07_12 | Explains why lightning is seen before thunder is heard during an electrical storm |
| S09_10 | Given the densities of two objects and three liquids, and diagrams showing the objects floating or sinking in the liquids, identifies each liquid |
| S10_07 | Recognizes which graph represents a musical note with given specifications for volume and pitch |
| S10_08 | Recognizes a free-body diagram that has a total force acting towards the right |
| S11_09 | Recognizes how to increase the strength of an electromagnet |
| S12_14 | Recognizes the type of energy transformation that occurs when a car begins to move from rest |
| S13_09B | Explains that in a parallel arrangement of two bulbs, one bulb failing does not affect the other bulb |
| S13_10 | Recognizes the best explanation of why two bar magnets repel each other |
| Earth Science |  |
| S01_14 | Recognizes a consequence of the gravitational pull of the Moon on Earth |

| S04_13 | Identifies a disadvantage of using solar energy |
| :---: | :---: |
| S04_14A | Recognizes the process that forms rock layers |
| S05_13 | Matches each of four processes that take place in the water cycle with the description of the process |
| S06_13 | Recognizes a non-renewable energy source |
| S07_13 | Describes a cause of earthquakes |
| S08_11 | Recognizes a major source of water for desalinization plants |
| S08_13 | Uses a diagram of a mountain range on the ocean and a given wind direction to recognize which location will have the greatest rainfall |
| S09_13 | Uses a graph of average monthly temperature to identify the city most likely to be located at the equator |
| S10_12 | Describes one geographic factor to consider when selecting a safe location for a nuclear power plant |
| S10_13A | Relates information in temperature graphs and maps to recognize climatic attributes of two cities |
| S11_12 | Recognizes the source of energy for the water cycle |
| S12_11A | Interprets information in a climate graph to determine the warmest and driest month of the year |
| S14_13 | Identifies how the melting of permafrost can affect the Earth's climate |
| S14_14 | Recognizes sources of fresh and salt water in a diagram |
| S14_15 | Synthesizes information in rainfall and temperature graphs to match 4 of 4 animals with the climates where they live (2 of 2 points) |
| Items at Advanced International Benchmark (625) |  |
| Biology |  |
| S01_01 | Identifies a function shared by lungs, skin, and kidneys |
| S01_02 | Classifies 7 of 7 animals into two groups based on a stated physical or behavioral characteristics (2 of 2 points) |
| S01_03 | Recognizes which organelle produces energy for the cell |
| S01_05 | Designs an investigation to find out how fertilizer affects plant growth using equipment shown in a diagram |
| S03_01 | Recognizes the function of shivering |
| S03_03B | In the context of an investigation about cellular respiration, identifies the gas produced and its source |
| S03_04 | Explains why offspring are unlikely to have traits dissimilar to their parents |

| S05_03 | Recognizes a function of the cell membrane |
| :---: | :---: |
| S05_04 | Recognizes an explanation for a change over time in a physical characteristic of an organism |
| S06_03 | Identifies the best conclusion supported by a diagram of limbs from different animals |
| S06_05B | Predicts the consequence for a prey population of increasing a predator population in a pond ecosystem |
| S07_02 | Recognizes an example of asexual reproduction and describes the characteristics of asexual reproduction |
| S07_03 | Identifies an organism in which gases are exchanged through the skin |
| S07_05B | Identifies and explains the stage of the life cycle during which a butterfly develops |
| S08_04 | Applies knowledge about the theory of evolution to identify the best conclusion supported by a diagram of limbs from different animals |
| S08_05 | Selects and classifies 4 of 4 foods from a list that comprise a balanced diet (2 of 2 points) |
| S08_06B | Selects and evaluates data from a table to draw a conclusion about the likely reason for a change in population of a species |
| S09_03A | Justifies a statement about crocodiles' adaptation to their environment, based on given facts |
| S09_04 | States one similarity between the life cycles of a bird and a frog |
| S09_05 | Identifies an explanation for disappearance of a trait over generations |
| S10_04A | Identifies two ways that plant and animal cells are similar (2 of 2 points) |
| S10_04B | States one way that plant and animal cells are different (1 of 2 points) |
| S12_05 | Recognizes an example of a symbiotic relationship between two organisms |
| S13_01 | States two reasons why male penguins' incubation behavior helps their eggs survive (2 of 2 points) |
| S14_04 | Recognizes the functions of 4 of 4 tissues found in the human stomach (2 of 2 points) |
| Chemistry |  |
| S01_06 | Recognizes a mixture |
| S02_05 | Recognizes whether characteristics of substances are physical or chemical properties |
| S02_06 | Recognizes a statement that best describes chemical reactions |
| S02_07 | Determines the color that results after a pH indicator is added to four solutions based on information provided about the indicator |
| S03_06 | Recognizes the reason for the difference in taste between distilled and drinking water |
| S04_08 | Recognizes whether 4 of 5 substances are elements, compounds, or mixtures (1 of 2 points) |

| S04_10 | Identifies and explains whether a described change is physical or chemical |
| :---: | :---: |
| S04_11 | Explains whether a reaction took place after a pH indicator is added to a solution based on information provided about the indicator |
| S05_08A | In the context of an investigation about the gold content of jewelry, describes the measurements to be taken using a graduated cylinder and water to find the volume of the jewelry |
| S07_10 | Applies knowledge of conservation of mass during a neutralization reaction to explain what happens to mass when new substances are formed |
| S07_11 | Applies knowledge of density to explain why oil floats on water |
| S08_03 | Applies knowledge of density to identify and explain which liquid will leave a dropper first after a mixture separates |
| S09_07 | Recognizes a property that is common to both acids and bases |
| S10_09 | Explains the difference between a solid and air in terms of particle spacing in context |
| S10_11 | Recognizes what happens to the atoms in an object pounded flat |
| S11_06 | Identifies an element as a metal or a nonmetal, based on a list of physical properties and predicts one additional property |
| S13_06 | Given their chemical formulas, recognizes a compound with the same number of atoms as another compound |
| S13_08 | Recognizes an everyday process that is an example of a physical change |
| Physics |  |
| S01_09 | Applies knowledge of expansion of water during freezing to explain why a bottle full of water cracked when it was left in a freezer |
| S01_12 | Applies knowledge of thermal conductivity to explain why ice will stay frozen in a wooden container longer than in a metal container |
| S02_10 | Explains whether one person can see another person in a practical problem involving reflection of light from plane mirrors |
| S03_08 | Given two unknown samples and using knowledge that only gases fill the available space, recognizes a statement about the spacing of particles in the samples |
| S03_09 | Recognizes the relative temperatures of the outside surfaces of containers made of materials with different thermal properties |
| S04_06 | Explains why a vehicle with tires is more likely to sink in the mud than a vehicle with treads |
| S04_07 | Recognizes an explanation for why a ball appears a certain color in a given context |
| S05_07 | Interprets a diagram to describe the direction of heat flow in metals |
| S05_11 | Describes a way to distinguish between fresh water and salt water, using two hot plates and without using a thermometer |
| S06_12 | Explains why one orientation of a rectangular block exerts the greatest pressure on the ground |
| S08_07 | Recognizes which property of sound allows animals to navigate and find food |

| S08_10 | Identifies and explains which of three methods will require the smallest force to move a heavy box onto a truck |
| :---: | :---: |
| S09_09 | Recognizes why gases are easier to compress than solids and liquids |
| S10_06 | Uses a diagram to explain one way to increase the strength of an electromagnet |
| S11_08 | Recognizes the property of a gas in a dented ping pong ball that stays constant if the ball is heated |
| S11_11 | Applies knowledge about the relationship between depth and water pressure to recognize a conclusion about the pressure at different depths |
| S12_13 | Draws a conclusion about the states of substances in two pistons, based on the different amounts of compression that occurred |
| S13_09A | States one reason why a bulb in a diagram of an electrical circuit does not light |
| S13_09C | Recognizes a correct statement about battery life and bulb brightness in two given electrical circuits |
| S14_07 | Recognizes whether a red object will absorb or reflect different colors of light |
| S14_08 | Indicates whether parts of a light bulb are electrical conductors or insulators |
| Earth Science |  |
| S02_01 | Recognizes whether each of five effects is a benefit of recycling paper (2 of 2 points) |
| S02_14 | From diagrams involving the Earth, Moon, and Sun, identifies the one that explains the changing seasons |
| S03_12B | Identifies the cause of decreasing water flow in an artesian well over time |
| S03_12C | Explains why water from an artesian well can be hot |
| S05_14 | Recognizes what causes the moon to appear to change shape |
| S06_14 | Uses a diagram to state two advantages of a plant having roots that reach into the subsoil (2 of 2 points) |
| S06_15 | Explains whether an object's weight is less on the Moon than on the Earth |
| S07_15 | Recognizes how a shadow changes throughout the day |
| S07_16 | Draws an arrow on a map to show the direction a river flows and explains why it flows in this direction |
| S09_12 | States one condition below Earth's crust that can be inferred from volcanic eruptions |
| S09_14 | Identifies an explanation for why a constellation visible one night is no longer visible six months later |
| S11_13 | Explains one way trees protect soil from erosion |
| S11_14 | Justifies a claim that the Moon travels around the Sun |
| S12_09 | Recognizes how oil is formed on Earth |

| S13_11B | Synthesizes information from tables about revolution times around and distances from the Sun to infer relative distances of planets from the Sun |
| :---: | :---: |
| S14_12 | Recognizes a negative effect that fertilizer can have on the environment |
| Items Above the Advanced International Benchmark (625) |  |
| Biology |  |
| S01_04B | Indicates in a table which gas is released into the air and which gas is removed from the air during plant respiration |
| S02_04B | Identifies two factors other than light intensity that could affect the rate of photosynthesis in an investigation (2 of 2 points) |
| S03_02 | Matches 4 of 4 animal groups to their characteristic features (2 of 2 points) |
| S03_03A | In the context of an investigation about cellular respiration, interprets the role of parts of an experimental set-up to provide a controlled condition |
| S04_02 | Recognizes 3 of 3 major organs in a diagram (2 of 2 points) |
| S07_05A | Identifies and explains the stage of the life cycle in which a butterfly grows |
| S08_06C | Predicts which species would best survive in a given environment, using information in a table, and provides a supporting explanation |
| S10_02 | States two substances plants obtain from their environment and use in photosynthesis (2 of 2 points) |
| S10_04B | States two ways that plant and animal cells are different (2 of 2 points) |
| S11_01B | Explains how influenza can be spread rapidly around the world |
| S11_04 | Explains how flooding leads to a shortage of drinking water and the spread of disease (2 of 2 points) |
| Chemistry |  |
| S03_07 | Recognizes whether everyday liquids will neutralize a base |
| S04_08 | Recognizes whether each of five substances is an element, a compound, or a mixture (2 of 2 points) |
| S06_08 | Given two proposed methods for separating a mixture of small pieces of two metals, identifies which method will work and explains why it will work and why the other method will not work (2 of 2 points) |
| S12_08 | Recognizes a property of a basic solution |
| S14_09 | Explains how painting a metal prevents rust from forming |
| S14_10 | Recognizes a true statement about neutral atoms |
| Physics |  |
| S01_10B | Recognizes that a falling ball will not bounce as high as the point from which it fell and explains why |

| S01_11 | Calculates resistance from current and voltage |
| :---: | :---: |
| S02_08 | Interprets a diagram showing heat transfer to recognize the relative temperatures of two blocks in water |
| S03_10 | From a diagram of an object floating in different liquids, explains that the portion of the object which is submerged depends on the density of the liquid |
| S04_09 | Explains how a substance can be in two different states in a container at one time in a given context |
| S05_10 | Recognizes what happens to the mass and volume of water when it freezes |
| S06_11 | Recognizes the correct statement about the relative motion of an object seen from two frames of reference |
| S08_08 | Recognizes how the temperature of water changes over time when heated |
| S10_05 | Recognizes how the mass of a metal ball will change as it cools down |
| Earth Science |  |
| S02_13 | Describes two things being done by car-makers to reduce air pollution (2 of 2 points) |
| S04_12 | Recognizes the gas that makes up most of Earth's atmosphere |
| S04_14B | Given a diagram, explains a process that shaped a rock formation in the ocean |
| S10_13B | Synthesizes information in temperature graphs and maps to recognize an explanation for the difference in seasonal climates of two cities at similar latitudes |
| S12_10 | Recognizes the relative composition of gases in Earth's atmosphere |
| S12_11B | Evaluates a conclusion about climate data, based on one week of weather observations |

## CHAPTER 15 :

## Creating and Interpreting the TIMSS 2015 Context Questionnaire Scales

Michael O. Martin Ina V.S. Mullis Martin Hooper Liqun Yin<br>Pierre Foy Lauren Palazzo

## Overview

As described in Chapter 2: Developing the TIMSS 2015 Context Questionnaires, many of the TIMSS 2015 context questionnaire items were developed to be combined into scales measuring a single underlying latent construct. For reporting, the scales were constructed using item response theory (IRT) scaling methods, specifically the Rasch partial credit model (Masters and Wright, 1997). As a parallel to the TIMSS International Benchmarks of achievement, each context scale allowed students to be classified into regions corresponding to high, middle, and low values on the construct. To facilitate interpretation of the regions, the cutpoints delimiting the regions were defined in terms of combinations of response categories. For certain scales that maintained many of the same items across TIMSS 2011 and TIMSS 2015, the scales were linked to allow for trend measurement on the background construct.

This chapter describes the procedures for constructing, interpreting, and validating scales based on responses to student, teacher, school, and home questionnaires, and then details the process for linking and reporting trend scales.

## Reporting TIMSS 2015 Context Questionnaire Scales

As an example illustrating the TIMSS approach to reporting context questionnaire data, Exhibit 15.1 presents the TIMSS 2015 Students' Sense of School Belonging scale at the eighth grade, a scale that was reported for the first time for the 2015 assessment. As the name suggests, this scale seeks
to measure students' feelings towards their school and connectedness with the school community. For each of the seven statements, students were asked to indicate the degree of their agreement with the statement: agree a lot, agree a little, disagree a little, or disagree a lot. Using IRT partial credit scaling, the data from student responses were placed on a scale constructed so that the scale centerpoint of 10 was located at the mean score across all TIMSS countries. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation across all countries. Students with a High Sense of School Belonging had a scale score greater than or equal to the point on the scale, 10.3 in this case, corresponding to agreeing a lot, on average, with four of the seven statements and agreeing a little with three of the statements. Students with Little Sense of School Belonging had a score no higher than the point (7.5) on the scale corresponding to disagreeing a little with four of the statements, on average, and agreeing a little with three of them.

Exhibit 15.1: Items in the TIMSS 2015 Students' Sense of School Belonging Scale, Eighth Grade

## Scaling Procedure

Partial credit IRT scaling is based on a statistical model that relates the probability that a person will choose a particular response to an item to that person's location on the underlying construct. In the TIMSS 2015 Students' Sense of School Belonging scale, the underlying construct is students' feelings about their school, and students who agree in general with the seven statements are assumed to have a greater sense of belonging and students who disagree with the statements are assumed to feel less belonging.

The partial credit model is shown below:

$$
P_{x_{i}}\left(\theta_{n}\right)=\frac{e^{\sum_{j=0}^{x_{i}}\left(\theta_{n}-\delta_{i}+\tau_{i j}\right)}}{\sum_{h=0}^{m_{i}} e^{\sum_{j=0}^{x_{i}}\left(\theta_{n}-\delta_{i}+\tau_{i j}\right)}} x_{i}=0,1, \ldots, m_{i}
$$

where $P_{x_{i}}\left(\theta_{n}\right)$ denotes the probability that person $n$ with location $\theta_{n}$ on the latent construct would choose response level $x_{i}$ to item $i$ out of the $m_{i}$ possible response levels for the item. The item parameter $\delta_{i}$ gives the location of the item on the latent construct and $\tau_{i j}$ denotes step parameters for the response levels. For each scale, the scaling procedure involves first estimating the $\delta_{i}$ and $\tau_{i j}$ item parameters, and then using the model with these parameters to estimate $\theta_{n}$, the score on the latent construct, for each on the $n$ respondents. Depending on the scale, respondents may be students, parents, teachers, or school principals.

The TIMSS 2015 context questionnaire scaling was conducted using the ConQuest 2.0 software (Wu, Adams, Wilson, \& Haldane, 2007).

In preparation for the context questionnaire scaling effort, the TIMSS \& PIRLS International Study Center developed a system of production programs that could effectively calibrate the items on each scale using ConQuest and produce scale scores for each scale respondent. Each assessment population (TIMSS fourth grade, TIMSS eighth grade) consisted of approximately 300,000 students, as well as their parents, teachers, and school principals. The estimation of the item parameters, a procedure also known as item calibration, was conducted on the combined data from all countries, with each country contributing equally to the calibration. This was achieved by assigning weights that sum to 500 for each country's student data. Exhibit 15.2 shows the international item parameters for the Students' Sense of School Belonging scale. For each item, the delta parameter $\delta_{i}$ shows the estimated overall location of the item on the scale, and the tau parameters $\tau_{i j}$ show the location of the steps, expressed as deviations from delta. Also, included in the right column is the Rasch infit item statistic, which is a measure of how well the data matches the model, with values above 1.3 indicating unexpected response patterns. As can be seen in this exhibit, the data seemed to match the model well for the seven items of the Belonging scale.

## Exhibit 15.2: Item Parameters for the TIMSS 2015 Students' Sense of School Belonging Scale, Eighth Grade

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| BSBG15A | 0.38218 | -0.95870 | -0.74432 | 1.70302 | 1.01 |
| BSBG15B | 0.07288 | -0.94599 | -0.58632 | 1.53231 | 0.99 |
| BSBG15C | 0.21160 | -0.83609 | -0.55012 | 1.38621 | 0.94 |
| BSBG15D | -0.73119 | -0.52286 | -0.46686 | 0.98972 | 1.17 |
| BSBG15E | 0.20067 | -0.98123 | -0.56256 | 1.54379 | 1.12 |
| BSBG15F | 0.26647 | -0.76246 | -0.50391 | 1.26637 | 0.91 |
| BSBG15G | -0.40261 | -0.89880 | -0.61886 | 1.51766 | 0.98 |

Once the calibration was completed and international item parameters were estimated, individual scores for each respondent (students, teachers, principals, or parents) were generated using weighted maximum likelihood estimation (Warm, 1989). All cases with valid responses to at least two items on a scale were included in the calibration and scoring processes.

The scale scores produced by the weighted likelihood estimation are in the logit metric with measured values ranging from approximately -5 to +5 . To convert to a more convenient reporting metric, a linear transformation was applied to the international distribution of logit scores for each scale, so that the resulting distribution across all countries had a mean of 10 and a standard deviation of 2. Exhibit 15.3 presents the scale transformation constants applied to the international distribution of logit scores for the Students' Sense of School Belonging scale to transform them to the $(10,2)$ reporting metric.

## Exhibit 15.3: Scale Transformation Constants for the TIMSS 2015 Students' Sense of School Belonging Scale, Eighth Grade

|  | Scale Transformation Constants |
| :---: | :---: |
| $A=7.847376$ | Transformed Scale Score $=7.847376+1.363355 \cdot$ Logit Scale Score |
| $B=1.363355$ |  |

To provide an approach to reporting the context questionnaire scales analogous to the TIMSS International Benchmarks for the TIMSS achievement scales, a method was developed to divide each scale into high, middle, and low regions and provide a content-referenced interpretation for these regions. For the TIMSS achievement scales, the Low, Intermediate, High, and Advanced International Benchmarks are specific reference points on the scale that can be used to monitor progress in student achievement. Using a scale anchoring procedure, student performance at each Benchmark is described in terms of the mathematics and science (depending on the subject) that students reaching that Benchmark know and can do. The percentage of students reaching each of these International Benchmarks can serve as a profile of student achievement in a country.

For the high, middle, and low regions of the context questionnaire scales, the interpretation is content-referenced to the extent that the boundaries of the regions were defined in terms of identifiable combinations of response categories. The particular response combinations that defined the regions boundaries, or cutpoints, were based on a judgment of what constituted a high or low region on each individual scale. For example, based on a consideration of the questions making up the Students' Sense of School Belonging scale, it was determined that in order to be in the high region of the scale and labeled "High Sense of School Belonging," a student would have to agree a lot, on average, to at least four of the seven statements and agree a little to the other three. Similarly, it was determined that a student who, on average, at most agreed a little with three of the statements and disagreed a little with the other four would be labeled to have "Little Sense of School Belonging."

The scale region cutpoints were quantified by assigning a numeric value to each response category, such that each respondent's responses to the scale's questions could be expressed as a "raw score." Assigning 0 to "Disagree a lot," 1 to "Disagree a little," 2 to "Agree a little," and 3 to "Agree a lot," results in raw scores on the Students' Sense of School Belonging scale ranging from 0 (disagree a lot with all seven statements) to 21 (agree a lot to all seven). A student who agreed a lot with four statements and agreed a little with the other three would have a raw score of $18(4 \times 3+3 \times 2)$. Following this approach, a student with a raw score of 18 or more would be in the "High Sense of School Belonging" region of the scale. Similarly, agreeing a little with three statements and disagreeing a little with four statements would result in a raw score of 10 $(3 \times 2+4 \times 1)$, so that a student with a raw score less than or equal to 10 would be in the "Little Sense of School Belonging" region.

A property of a Rasch scale is that each raw score has a unique scale score associated with it. Exhibit 15.4 presents a raw score-scale score equivalence table for the Students' Sense of School Belonging scale. From this table, it can be seen that a raw score of 10 corresponds to a scale score of 7.5 (rounding up) and a raw score of 18 corresponds to a scale score of 10.3 (rounding down). ${ }^{1}$ These scale scores were the cutpoints used to divide the scale into the three regions.

[^13]Exhibit 15.4: Equivalence Table of Raw and Transformed Scale Scores for the TIMSS 2015 Students' Sense of School Belonging Scale, Eighth Grade

| Raw Score | Transformed Scale Score | Cutpoint |

## Linking Procedures for Trend Context Questionnaire Scales

As a new initiative, trend results in the form of changes from 2011 to 2015 were reported for 12 fourth grade and 20 eighth grade context questionnaire scales. For these trend scales, linking procedures were implemented to place the data from the two cycles on a common metric. This section describes the procedures for measuring trends-placing data for the TIMSS 2015 context questionnaire scales onto the TIMSS 2011 metric and validating this process.

As described in Chapter 2, with each cycle of TIMSS, the questionnaires are revised to keep up with the times and to improve the measurement of the constructs. Using context questionnaire IRT scales to measure background constructs began with TIMSS 2011, and during the development phase of the TIMSS 2015 questionnaires, a conscious effort was made to increase the number of items contributing to each scale in order to enhance scale reliability. The context scales used to
measure trends in TIMSS 2015 have items common to both TIMSS 2011 and TIMSS 2015-also called trend items-and new items unique to TIMSS 2015. Generally, a context questionnaire scale was considered for trend reporting in 2015 if it had a sufficient number of items in common with 2011: a minimum of 5 common items and more than half of the TIMSS 2015 items being common items.

As an example, Exhibit 15.5 shows the TIMSS 2015 Students Confident in Mathematics scale for fourth grade students-one of the scales where trend measurement was reported. This scale measures how confident students feel about their ability in mathematics, in terms of their level of agreement with nine statements about mathematics. Statements expressing negative sentiment were reverse coded during the scaling. Seven of the nine statements were common to the TIMSS 2011 and TIMSS 2015 versions of this scale, with ' T ' for trend identifying these items to the left of their variable name. Two new statements were added to the seven common items to improve the measure of Students Confident in Mathematics for TIMSS 2015.

Exhibit 15.5: Items in the TIMSS 2015 Students Confident in Mathematics Trend Scale, Fourth Grade

T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

The IRT calibration and scoring methods for trend scales were the same as those used for the new context scales. The data for these nine items were calibrated across all TIMSS 2015 countries using the Rasch partial credit model, and, through this calibration, item parameters were estimated on a logit scale that was unique to the 2015 cycle. Following calibration, weighted maximum likelihood estimation was used to derive Rasch logit scale scores based on these estimated item
parameters for all countries and benchmarking participants, and as such student scores were placed on this 2015 logit metric. Although similar, the TIMSS 2015 logit metric is not identical to the TIMSS 2011 logit metric, and thus the TIMSS 2015 scores needed to be transformed to the 2011 metric to allow for trend reporting.

This linking was achieved through a two-step transformation process. The first transformation-with linear constants $A_{1}$ and $B_{1}$-placed the TIMSS 2015 logit scale scores on the TIMSS 2011 logit metric, and the second transformation—with linear constants $A_{2}$ and $B_{2}$ transformed the TIMSS 2011 logit metric to the TIMSS scale metric, which uses the $(10,2)$ metric described earlier. To increase the efficiency of this transformation process and reduce rounding errors, both transformations were combined into one calculation using the equations below to create a set of final scale transformation constants, $A$ and $B$ :

$$
\begin{gathered}
B=B_{2} \cdot B_{1} \\
A=A_{2}+B_{2} \cdot A_{1}
\end{gathered}
$$

The first set of transformation parameters, $A_{1}$ and $B_{1}$, were obtained by applying the mean/ sigma method (Kolen \& Brennan, 2004) to the two sets of common item parameters: one from the current calibration of TIMSS 2015 data and the other from the previous calibration of TIMSS 2011 data. The mean and standard deviation of the estimates of the difference between item location and item step parameter, $\left(\delta_{i}-\tau_{i j}\right)$, were first found over all common items and all categories for each calibration. The transformation parameters $A_{1}$ and $B_{1}$ were calculated based on these two sets of means and standard deviations:

$$
\begin{gathered}
B_{1}=\frac{S D_{c 11}}{S D_{c 15}} \\
A_{1}=M N_{c 11}-\frac{S D_{c 11}}{S D_{c 15}} \cdot M N_{c 15}
\end{gathered}
$$

where $M N_{c 15}$ and $S D_{c 15}$ are the mean and standard deviation of the estimates of $\left(\delta_{i}-\tau_{i j}\right)$ of all common items and categories from the current calibration on TIMSS 2015 data; $M N_{c 11}$ and $S D_{c 11}$ are the mean and standard deviation of the estimates of $\left(\delta_{i}-\tau_{i j}\right)$ of all common items and categories from the previous calibration on TIMSS 2011 data.

The second set of transformation parameters, $A_{2}$ and $B_{2}$, were retrieved from the scale transformations which were established in 2011 for reporting. This transformation aimed to place the resulting Rasch scores on the TIMSS $(10,2)$ trend reporting metric.

Exhibit 15.6 presents the final trend scale transformation constants applied to the TIMSS 2015 international distribution of logit scale scores for the Students Confident in Mathematics trend scale to transform them to the $(10,2)$ trend reporting metric.

## Exhibit 15.6: Scale Transformation Constants for the TIMSS 2015 Students Confident in Mathematics Scale, Fourth Grade

## Scale Transformation Constants

$A=8.5562$
$B=1.599041$$\quad$ Transformed Scale Score $=8.5562+1.599041 \cdot$ Logit Scale Score

To assess the accuracy of the linking, item parameter estimates for the trend items were compared across the two cycles by examining the differences between the TIMSS 2015 item parameter estimates after being transformed to the TIMSS 2011 logit metric, and the TIMSS 2011 item parameter estimates on the 2011 logit scale. Exhibit 15.7 presents the differences between these estimates for the Students Confident in Mathematics trend scale. As can be seen in the exhibit, the differences were at an acceptable level for both location and step parameters, with most deviations being less than 0.1.

## Validating the TIMSS 2015 Context Questionnaire Scales

As evidence that the context questionnaire scales provide comparable measurement across countries, reliability coefficients were computed for each scale for every country and benchmarking participant, and a principal components analysis of the scale items was conducted. Exhibit 15.8 presents the results of this analysis for the Students Confident in Mathematics scale. The Cronbach's Alpha reliability coefficients generally were at an acceptable level, with almost all above 0.7 and many above 0.8 . The exhibit also shows the percentage of variance among the scale items accounted for by the first principal component in each country. In most cases this was acceptably high, indicating that the items could be adequately represented by a single scale. The component loadings of each questionnaire item from the principal components analysis are positive and substantial, indicating a strong correlation between each item and the scale in every country.

Exhibit 15.8: Cronbach's Alpha Reliability Coefficient and Principal Components Analysis of the TIMSS 2015 Students Confident in Mathematics Scale, Fourth Grade

As indicators of effective environments for learning, a positive relationship with achievement is an important aspect of validity for the TIMSS context questionnaire scales. For the Students

Confident in Mathematics scale, Exhibit 15.9 presents the Pearson correlation with mathematics achievement in TIMSS 2015 for each country, together with $r$-squared-the proportion of variance in mathematics and science achievement attributable to the Students Confident scale. These figures show a moderate relationship with achievement across participating countries. Also shown is the proportion of variance in achievement attributable to differences between the regions of the Students Confident scale. This is very similar to the proportion of variance explained by the scale as a whole, indicating that dividing the scale into regions loses little of its power to account for achievement differences.

Exhibit 15.9: Relationship Between the TIMSS 2015 Students Confident in Mathematics Scale, Fourth Grade, and TIMSS 2015 Mathematics Achievement

Item parameter estimates and item and scale statistics similar to those above are available in Appendix 15A for each of the fourth grade TIMSS 2015 context questionnaire scales and in Appendix 15B for each of the eighth grade context questionnaire scales.

## Reporting the TIMSS 2015 Trend Context Questionnaire Scales

Exhibit 15.10 shows an excerpt from the Students Confident in Mathematics exhibit at the fourth grade. To represent trends from 2011, the two columns to the right of the exhibit present the average scale score in 2015 for each country and the difference from the average in 2011, respectively. Up and down arrows indicate whether the trend difference is significantly higher or lower in 2015, with a $99 \%$ level of confidence.

Trend results were not reported for the percentage of students in each region. To facilitate interpretation of the region boundaries in terms of combinations of response categories, trend scales followed the same procedure as non-trend scales in setting cutpoints for classification into regions. As such, the procedure was primarily dependent on similarities in response patterns without taking into account variations in difficulty across the items that were unique to 2011 or 2015. Consequently, although the cutpoints generally are quite close across the two cycles, they are not identical and therefore it was considered most appropriate to use differences in scale score means rather than changes in the percentages in scale regions as indicators of trend.

Exhibit 15.10: Excerpt from Students Confident in Mathematics Exhibit, Fourth Grade
Reported by Students
Students were scored according to their degree of agreement with nine statements on the Students Confident in Mathematics scale. Students Very Confident in Mathematics had a score on the scale of at least 10.6, which corresponds to their "agreeing a lot" with five of the nine statements and "agreeing a little" with the other four, on average. Students who were Not Confident in Mathematics had a score no higher than 8.5 , which corresponds to their "disagreeing a little" with five of the nine statements and "agreeing a little" with the other four, on average. All other students were Confident in Mathematics.

## Early Literacy and Numeracy Activities Before Beginning Primary School Scale, Fourth Grade

The Early Literacy and Numeracy Activities Before Beginning Primary School (ELN) scale was created based on parents' frequency of doing the sixteen activities described below.

Items in the TIMSS 2015 Early Literacy and Numeracy Activities Before Beginning Primary School Scale, Fourth Grade

| T |  | Before your child began primary/elementary school, how often did you or someone else in your home do the following activities with him or her? |
| :---: | :---: | :---: |
|  |  | Often Sometimes Never or |
|  | ASBH02A |  |
| T | ASBH02B |  |
| T | ASBH02C |  |
| T | ASBH02D | 4) Play with alphabet toys (e.g., blocks with letters of the alphabet) ----- |
| T | ASBH02E |  |
| T | ASBH02F |  |

## Parental Attitude Toward Mathematics and Science Scale, Fourth Grade

The Parental Attitude Toward Mathematics and Science (AMS) scale was created based on parents' responses to the eight statements described below.

Items in the TIMSS 2015 Parental Attitude Toward Mathematics and Science Scale, Fourth Grade ${ }^{1}$

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Disagree a little" and "Disagree a lot" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

## Parents’ Perceptions of School Performance Scale, Fourth Grade

The Parents' Perceptions of School Performance (PSP) scale was created based on parents' responses to the eight statements described below.

Items in the TIMSS 2015 Parents' Perceptions of School Performance Scale, Fourth Grade ${ }^{1}$

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Disagree a little" and "Disagree a lot" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

Item Parameters for the TIMSS 2015 Parents' Perceptions of School Performance Scale,

## School Emphasis on Academic SuccessTeachers' Reports Scale, Fourth Grade

The School Emphasis on Academic Success-Teachers' Reports (EAS) scale was created based on teachers' responses characterizing the fourteen aspects described below.

Items in the TIMSS 2015 School Emphasis on Academic Success-Teachers' Reports Scale, Fourth Grade ${ }^{1}$

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Low" and "Very low" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing

## Schools Where Students Enter the Primary Grades with Literacy and Numeracy Skills Scale, Fourth Grade

The Schools Where Students Enter the Primary Grades with Literacy and Numeracy Skills (LNS) scale was created based on principals' responses about the percentage of children in the school who began first grade with the eleven key skills described below.

Items in the TIMSS 2015 Schools Where Students Enter the Primary Grades with Literacy and Numeracy Skills Scale, Fourth Grade

## Students Confident in Science Scale, Fourth Grade

The Students Confident in Science (SCS) scale was created based on students' degree of agreement with the seven statements described below.

Items in the TIMSS 2015 Students Confident in Science Scale, Fourth Grade

T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

Item Parameters for the TIMSS 2015 Students Confident in Science Scale, Fourth Grade

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |

## Students Like Learning Science Scale, Fourth Grade

The Students Like Learning Science (SLS) scale was created based on students' degree of agreement with the nine statements described below.

Items in the TIMSS 2015 Students Like Learning Science Scale, Fourth Grade

T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

Item Parameters for the TIMSS 2015 Students Like Learning Science Scale, Fourth Grade

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ASBS04A | -0.03177 | -0.48837 | -0.55624 | 1.04461 | 0.81 |
| ASBS04B* | 0.54508 | -0.31578 | -0.16722 | 0.48300 | 1.53 |
| ASBSO4C* | 0.36011 | -0.48672 | -0.06029 | 0.54701 | 1.28 |
| ASBS04D | -0.49710 | -0.28238 | -0.48794 | 0.77032 | 0.95 |
| ASBS04E | -0.00762 | -0.45509 | -0.40061 | 0.85570 | 0.65 |
| ASBS04F | 0.32089 | -0.78932 | -0.22311 | 1.01243 | 0.85 |
| ASBS04G | -0.63912 | -0.42807 | -0.58269 | 1.01076 | 1.21 |
| ASBS04H | -0.63548 | -0.16495 | -0.39717 | 0.56212 | 1.38 |
| ASBS04I | 0.58501 | -0.73823 | -0.18404 | 0.92227 | 0.93 |

## Students’ Views on Engaging Teaching in Mathematics Lessons Scale, Fourth Grade

The Students' Views on Engaging Teaching in Mathematics Lessons (EML) scale was created based on students' degree of agreement with the ten statements described below.

Items in the TIMSS 2015 Students' Views on Engaging Teaching in Mathematics Lessons Scale, Fourth Grade

\begin{tabular}{|c|c|}
\hline \& How much do you agree with these statements about your mathematics lessons? \\
\hline \& \begin{tabular}{llll} 
Agree \& \begin{tabular}{l} 
Agree \\
a little
\end{tabular} \& \begin{tabular}{l} 
Disagree \\
a little
\end{tabular} \& \begin{tabular}{l} 
Disagree \\
a lot
\end{tabular}
\end{tabular} \\
\hline ASBM02A \& 1) I know what my teacher expects me to do \\
\hline ASBM02B \& 2) My teacher is easy to understand ---------------------->>-○- \\
\hline ASBM02C \& 3) I am interested in what my teacher says ------------ \(\bigcirc\) \\
\hline ASBM02D \& 4) My teacher gives me interesting things to do ------ \\
\hline ASBM02E \& 5) My teacher has clear answers to my questions ---- \(\bigcirc\) \\
\hline ASBM02F \& 6) My teacher is good at explaining mathematics ---- \(\bigcirc\) \\
\hline ASBM02G \& 7) My teacher lets me show what I have learned------- \(\bigcirc\) \\
\hline ASBM02H \& 8) My teacher does a variety of things to help us learn \(\qquad\)
\(\qquad\)

$\qquad$ <br>

\hline ASBM02I \& | 9) My teacher tells me how to do better when |
| :--- |
| I make a mistake $\qquad$ | <br>

\hline ASBM02J \& 10) My teacher listens to what I have to say ------------ $\bigcirc$ <br>
\hline \&  <br>
\hline
\end{tabular}

## Teacher Job Satisfaction Scale, Fourth Grade

The Teacher Job Satisfaction (TJS) scale was created based on how often teachers responded positively to the seven statements described below.

Items in the TIMSS 2015 Teacher Job Satisfaction Scale, Fourth Grade'

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Sometimes" and "Never or almost never" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

Item Parameters for the TIMSS 2015 Teacher Job Satisfaction Scale, Fourth Grade

## Teachers Emphasize Science Investigation Scale, Fourth Grade

The Teachers Emphasize Science Investigation (ESI) scale was created based on teachers' responses to how often they used the eight instructional activities described below.

Items in the TIMSS 2015 Teachers Emphasize Science Investigation Scale, Fourth Grade ${ }^{1}$

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Some Lessons" and "Never" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

Item Parameters for the TIMSS 2015 Teachers Emphasize Science Investigation Scale, Fourth Grade

| Item | delta | tau_1 | tau_2 | Infit |
| :--- | :---: | :---: | :---: | :---: |
| ATBS03B | -0.97859 | -1.00917 | 1.00917 | 1.54 |
| ATBS03C | -0.43524 | -0.63501 | 0.63501 | 1.34 |
| ATBS03D | 0.08764 | -0.94529 | 0.94529 | 0.86 |
| ATBS03E | -0.19774 | -0.99274 | 0.99274 | 0.81 |

## Teaching Limited by Student Needs Scale, Fourth Grade

The Teaching Limited by Student Needs (LSN) scale was created based on teachers' responses concerning six needs described below.

Items in the TIMSS 2015 Teaching Limited by Student Needs Scale, Fourth Grade

Item Parameters for the TIMSS 2015 Teaching Limited by Student Needs Scale, Fourth
Grade

| Item | delta | tau_1 | tau_2 | Infit |
| :--- | :---: | :---: | :---: | :---: |
| ATBG15A | 0.90362 | -2.02080 | 2.02080 | 1.02 |
| ATBG15B | -1.27753 | -1.05996 | 1.05996 | 1.04 |
| ATBG15C | -0.43516 | -1.62325 | 1.62325 | 0.98 |

## Appendix 15B: TIMSS 2015 Context Questionnaire Scales, Eighth Grade

## Challenges Facing Teachers Scale, Eighth Grade

The Challenges Facing Teachers (CFT) scale was created based on teachers' degree of agreement with the eight statements described below.

Items in the TIMSS 2015 Challenges Facing Teachers Scale, Eighth Grade

Item Parameters for the TIMSS 2015 Challenges Facing Teachers Scale, Eighth Grade

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |

## Problems with School Conditions and Resources-Teachers' Reports Scale, Eighth Grade

The Problems with School Conditions and Resources-Teachers' Reports (SCR) scale was created based on teachers' responses concerning seven conditions and resources described below.

Items in the TIMSS 2015 Problems with School Conditions and Resources-Teachers' Reports Scale, Eighth Grade

Item Parameters for the TIMSS 2015 Problems with School Conditions and Resources - Teachers' Reports Scale, Eighth Grade

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |

## Safe and Orderly School-Teachers' Reports Scale, Eighth Grade

The Safe and Orderly School-Teachers' Reports (SOS) scale was created based on teachers' degree of agreement with the eight statements described below.

Items in the TIMSS 2015 Safe and Orderly School-Teachers' Reports Scale, Eighth Grade ${ }^{1}$

T Trend item-item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.
1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Disagree a little" and "Disagree a lot" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

## School Emphasis on Academic SuccessTeachers' Reports Scale, Eighth Grade

The School Emphasis on Academic Success-Teachers' Reports (EAS) scale was created based on teachers' responses characterizing the fourteen aspects described below.

Items in the TIMSS 2015 School Emphasis on Academic Success-Teachers' Reports Scale, Eighth Grade ${ }^{1}$

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Low" and "Very low" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

## Student Bullying Scale, Eighth Grade

The Student Bullying (SB) scale was created based on students' responses to how often they experienced the nine bullying behaviors described below.

Items in the TIMSS 2015 Student Bullying Scale, Eighth Grade

Item Parameters for the TIMSS 2015 Student Bullying Scale, Eighth Grade

## Students Confident in Biology Scale, Eighth Grade

The Students Confident in Biology (SCB) scale was created based on students' degree of agreement with the eight statements described below.

Items in the TIMSS 2015 Students Confident in Biology Scale, Eighth Grade

T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

## Students Like Learning Biology Scale, Eighth Grade

The Students Like Learning Biology (SLB) scale was created based on students' degree of agreement with the nine statements described below.

Items in the TIMSS 2015 Students Like Learning Biology Scale, Eighth Grade

T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

## Students Value Mathematics Scale, Eighth Grade

The Students Value Mathematics (SVM) scale was created based on students' degree of agreement with the nine statements described below.

Items in the TIMSS 2015 Students Value Mathematics Scale, Eighth Grade

T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

Item Parameters for the TIMSS 2015 Students Value Mathematics Scale, Eighth Grade

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| BSBM20A | -0.09861 | -0.83768 | -0.54142 | 1.37910 | 1.06 |

## Students Value Science Scale, Eighth Grade

The Students Value Science (SVS) scale was created based on students' degree of agreement with the nine statements described below.

Items in the TIMSS 2015 Students Value Science Scale, Eighth Grade

T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

Item Parameters for the TIMSS 2015 Students Value Science Scale, Eighth Grade

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| BSBS24A | -0.49782 | -1.43829 | -0.52891 | 1.96720 | 1.12 |
| BSBS24B | 0.23455 | -1.99011 | -0.10911 | 2.09922 | 1.17 |

## Students’ Views on Engaging Teaching in Mathematics Lessons Scale, Eighth Grade

The Students' Views on Engaging Teaching in Mathematics Lessons (EML) scale was created based on students' degree of agreement with the ten statements described below.

Items in the TIMSS 2015 Students' Views on Engaging Teaching in Mathematics Lessons Scale, Eighth Grade

|  | How much do you agree with these statements about your mathematics lessons? |
| :---: | :---: |
|  | Agree Agree <br> a lot Disagree <br> a little Disagree <br> a little <br> a lot    |
| BSBM18A | 1) I know what my teacher expects me to do |
| BSBM18B |  |
| BSBM18C | 3) I am interested in what my teacher says ------------ $\bigcirc$ |
| BSBM18D | 4) My teacher gives me interesting things to do ----- $\bigcirc$ |
| BSBM18E | 5) My teacher has clear answers to my questions ---- $\bigcirc$ |
| BSBM18F | 6) My teacher is good at explaining mathematics ---- $\bigcirc$ |
| BSBM18G | 7) My teacher lets me show what I have learned------ $\bigcirc$ |
| BSBM18H | 8) My teacher does a variety of things to help us learn $\qquad$ $\qquad$ |
| BSBM18I | 9) My teacher tells me how to do better when <br> I make a mistake $\qquad$ <br> $\bigcirc$ <br> $\bigcirc$ $\qquad$ |
| BSBM18J | 10) My teacher listens to what I have to say ----------- $\bigcirc$ |
|  | Very <br> Engaging Engaging <br> Teaching <br> Teaching $_{10.4}$ Less than Engaging <br> Teaching <br>  8.2 |

Item Parameters for the TIMSS 2015 Students' Views on Engaging Teaching in Mathematics Lessons Scale, Eighth Grade

## Teacher Job Satisfaction Scale, Eighth Grade

The Teacher Job Satisfaction (TJS) scale was created based on how often teachers responded positively to the seven statements described below.

Items in the TIMSS 2015 Teacher Job Satisfaction Scale, Eighth Grade ${ }^{1}$

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Sometimes" and "Never or almost never" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

## Teachers Emphasize Science Investigation Scale, Eighth Grade

The Teachers Emphasize Science Investigation (ESI) scale was created based on teachers' responses to how often they used the eight instructional activities described below.

Items in the TIMSS 2015 Teachers Emphasize Science Investigation Scale, Eighth Grade ${ }^{1}$

1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Some Lessons" and "Never" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

## Teaching Limited by Student Needs Scale, Eighth Grade

The Teaching Limited by Student Needs (LSN) scale was created based on teachers' responses concerning six needs described below.

Items in the TIMSS 2015 Teaching Limited by Student Needs Scale, Eighth Grade

Item Parameters for the TIMSS 2015 Teaching Limited by Student Needs Scale, Eighth Grade

| Item | delta | tau_1 | tau_2 | Infit |
| :--- | :---: | :---: | :---: | :---: |
| BTBG15A | 1.14171 | -1.83653 | 1.83653 | 1.03 |
| BTBG15B | -1.14425 | -1.12334 | 1.12334 | 1.09 |
| BTBG15C | -0.16051 | -1.68796 | 1.68796 | 1.04 |
| BTBG15D | 0.30396 | -1.44379 | 1.44379 | 0.94 |
| BTBG15E | 0.86567 | -1.84509 | 1.84509 | 0.89 |
| BTBG15G | -1.00658 | -1.45309 | 1.45309 | 1.07 |

Scale Transformation Constants for the TIMSS 2015 Teaching Limited by Student Needs Scale, Eighth Grade

| Scale Transformation Constants |  |
| ---: | :--- |
| $A=9.392409$ | Transformed Scale Score $=9.392409+1.217478 \cdot$ Logit Scale Score |
| $B=1.217478$ |  |

TIMSS
2015

Equivalence Table of Raw and Transformed Scale Scores for the TIMSS 2015 Teaching Limited by Student Needs Scale, Eighth Grade

| Raw Score | Transformed <br> Scale Score | Cutpoint |
| :---: | :---: | :---: |
| 0 | 4.10087 |  |
| 1 | 5.69119 |  |
| 2 | 6.59237 |  |
| 3 | 7.31350 |  |
| 4 | 7.96367 |  |
| 5 | 8.59178 |  |
| 6 | 9.23167 | 11.4 |
| 7 | 9.91091 |  |
| 8 | 10.64876 |  |
| 9 | 11.44991 |  |

[^0]:    Michael O. Martin, Ina V.S. Mullis, Martin Hooper, Liqun Yin, Pierre Foy, and Lauren Palazzo

[^1]:    1 When schools are sampled, schools are ordered within explicit strata by implicit stratification variables and the measure of size. Based on this sorting, successively sampled schools are matched and classified together in each sampling zone. More information can be found in Appendix 3 A of Chapter 3.
    2 If a remaining school consists of 2 sampled classrooms, each classroom becomes a "quasi" school.

[^2]:    3 Prior to 2015, TIMSS used 75 subsamples and sets of replicate weights to calculate the JRR sampling variances. To provide more accurate estimates, starting in 2015 TIMSS uses 150 subsamples and sets of replicate weights to calculate the JRR sampling variances. Two subsamples are drawn from each sampling zone rather than one randomly selected subsample.

[^3]:    Students attending a sampled class at the time the sample was chosen but leaving the class before the assessment was administered were classified as "withdrawn." Students with a disability or language barrier that prevented them from participating in the assessment were classified as "excluded."
    Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as "absent."

[^4]:    * Certainty Regions

[^5]:    1 The Early Learning Survey, which is completed by parents/guardians, is administered only at the fourth grade.

[^6]:    1 This description of the TIMSS achievement scaling methodology has been adapted with permission from the TIMSS 1999 Technical Report (Yamamoto and Kulick, 2000).
    2 For a description of IRT scaling see Birnbaum (1968); Lord and Novick (1968); Lord (1980); Van Der Linden and Hambleton (1996). The theoretical underpinning of the multiple imputation methodology was developed by Rubin (1987), applied to large-scale assessment by Mislevy (1991), and studied further by Mislevy, Johnson and Muraki (1992) and Beaton and Johnson (1992). For a recent overview, see von Davier and Sinharay (2014) and von Davier (2014). The procedures used in TIMSS have been used in several other large-scale surveys, including the U.S. National Assessment of Educational Progress (NAEP), the U.S. National Adult Literacy Survey (NALS), the International Adult Literacy Survey (IALS), and the International Adult Literacy and Life Skills Survey (IALLS).

[^7]:    1 See Mazzeo and von Davier (2014) for a discussion of the linking procedure used by TIMSS.

[^8]:    2 The difference between the ability distributions of the previous assessment data under the two calibrations is a measure of the linkage error in the trend scaling procedure.

[^9]:    3 The TIMSS assessment booklets consist of two parts, with a break in between.

[^10]:    4 The process of generating criterion-scaled variables is described in Beaton (1969).
    5 The number of principal components retained is limited to no more than $5 \%$ of a country's student sample size, thereby possibly reducing the percentage of variance accounted for, to avoid over-specification of the conditioning model.

[^11]:    * Items with fixed item parameters estimated in TIMSS 2015 fourth grade item calibration.

[^12]:    * Items with fixed item parameters estimated in TIMSS 2015 fourth grade item calibration.

[^13]:    1 The reason for rounding was to facilitate reporting, and it was decided that the highest cutpoint would be rounded down to ensure that those with an unrounded scale score (e.g., 10.39858 for the Belonging scale) at the cutpoint were included within the highest region. For a similar reason, the lower cutpoint was rounded up.

[^14]:    A dash (-) indicates comparable data not available.

[^15]:    T Trend item-item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^16]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.
    1 Derived variable. For more details, see Supplement 3 of the User Guide for the TIMSS 2015 International Database.

[^17]:    A dash (-) indicates comparable data not available.

[^18]:    1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Disagree a little" and "Disagree a lot" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.
    T Trend item-item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^19]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^20]:    A dash (-) indicates comparable data not available.

[^21]:    1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Low" and "Very low" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.

[^22]:    A dash (-) indicates comparable data not available.

[^23]:    T Trend item-item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^24]:    *Reverse coded

[^25]:    T Trend item-item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^26]:    A dash (-) indicates comparable data not available.

[^27]:    A dash (-) indicates comparable data not available.

[^28]:    T Trend item-item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.
    1 Derived variable. For more details, see Supplement 3 of the User Guide for the TIMSS 2015 International Database.

[^29]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales

[^30]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^31]:    A dash (-) indicates comparable data not available.

[^32]:    1 For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Low" and "Very low" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing

[^33]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales

[^34]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^35]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^36]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^37]:    T Trend item-item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^38]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^39]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^40]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.

[^41]:    T Trend item—item was included in the same scale in TIMSS 2011 and was used for linking the TIMSS 2011 and TIMSS 2015 scales.
